STORNOPHONE 4000

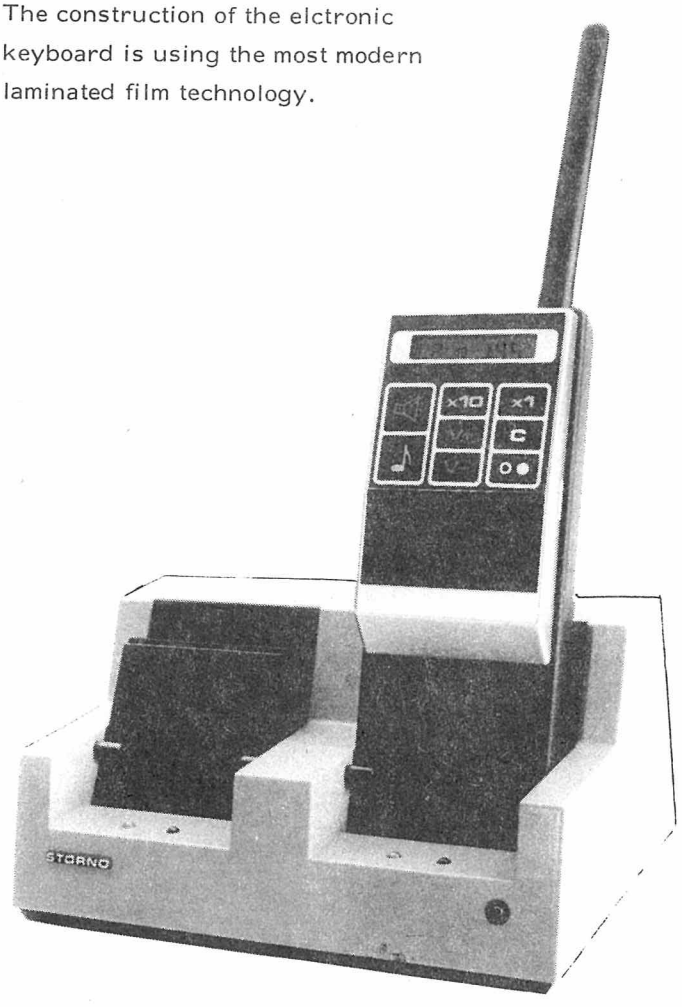
Local controlled personal radio for simplex or semi duplex operation with all necessary indicators located in a liquid crystal display.

The construction of the elctronic keyboard is using the most modern laminated film technology.



The fully automatic charger CU4001 provides charging of either the battery alone or when inserted in the radio.

GENERAL SPECIFICATIONS

GENERAL DESCRIPTION

CQP4000

STORNOPHONE 4000 is a personal radiotelephone with transmitter, receiver, controls and display, loudspeaker, microphone and battery.
Although being handheld and compact in size the radio can be programmed with two channels and optionally, be equipped with sequential tone encoder/decoder, CTCSS (channel guard) encoder, or CTCSS (channel guard) encoder/decoder.

The mechanical construction of the radio is a screened enclosure in the form of a cast chassis and a metalized plastic front as lid.
A moulded plastic house is attached to the chassis to provide mechanical protection and hold the battery. All controls and indicators are integrated in a keypad/display field on the radio front except for the transmit button which is on the left side of the radio. The electrical circuitry of the radio is built on printed wiring boards: an RF-board containing the transmitter and receiver, a control logic board and, optionally, a thick film tone module.
The RF-board comprises the frequency synthesizer, the transmitter exciter and power amplifier, the receiver RF circuits and IF-circuits, the voltage regulator, and is available in different versions according to frequency band and channel spacing.
The control logic board (CL) comprises the receiver AF amplifier, the transmitter modulation processor, the microcontroller and the display.
The tone module is a thick-film add-on module designed to be plugged into a socket on the CL-board.

ANTENNAS

The CQP4000 is designed for a 50-ohm antenna which is screwed onto the top of the radio. The following types are available:

- a resonant helical antenna, AN4xx1
- a wide band conductive rubber antenna, AN4xx2

BATTERIES

The battery is designed to snap into a compartment at the bottom of the radio and is a selfcontained nickel-cadmium (Ni-Cd) pack.
Two battery packs are available:

- a 450 mA battery, BU4001
- a 750 mA battery, BU4002

CARRYING DEVICES

The following devices are available for carrying the radio:

- a carrying kit consisting of a strap and eyelets to be inserted in the plastic housing, CK4001.
- a carrying case made of black leather with a display window and flaps for access to the controls and the battery, CK4002.

BATTERY TESTER

A battery tester is available for checking the charge condition of batteries. A button on the tester loads the battery and the charge condition is read on a meter scale, SI4001.

OPERATING INSTRUCTIONS

All buttons, except the transmit button, will when pressed respond with an attention tone, approx. 40 ms long, to give the operator an indication of a depressed button.

ON/OFF/DISPLAY LIGHT

When the battery is inserted the radio is turned on by pressing the ON/OFF button. When the radio turns on the display light is on for a short time and the light timer will be reset each time a button is pressed. The radio will be on first used channel and variable tone digits, if used, set to 00. For sets with sequential tone receiver the loudspeaker will be off.
If the tone receiver is not fitted the loudspeaker is always on and the call indicator is not used.

The display light is turned on by pressing the ON/OFF button once.

The radio can only be turned off while the display light is on. To turn off press the ON/OFF button to light the display if not already on and then again press the ON/OFF button. Before the control logic turns the radio off a high pitch tone is sounded for 1 second the volume being independent of the present volume setting.
When the battery is discharged and reach a certain voltage, the radio emits an acoustic alarm tone to inform the operator that the battery has to be replaced. The alarm tone is similar to that emitted when turning the radio off and if the operator does not turn the radio off the control logic will automatically turn off.
The battery condition is monitored only when the radio is in receive mode.

CHANNEL SELECTION

When turned on the radio will be set to first used channel. To select next channel press the channel select button, C.
Channel selection can only take place while in receive mode.

VOLUME SETTING

The loudspeaker volume can be adjusted in steps. There are 8 levels and when the radio is turned on the volume is automatically set to medium.

To increase the volume press V+ and to lower the volume press V-. When the higher or lower limit is reached the volume can not be further adjusted until the opposite button is pressed. Each time a volume button is pressed the radio emits a short attention tone.

LOUDSPEAKER ON/OFF (MONITOR)

This button and its display symbol is used with sequential tone option only.

With the sequential tone receiver option the loudspeaker is off when the radio is turned on. When the loudspeaker button is pressed the loudspeaker is turned on and the call indicator displayed. The loudspeaker is automatically turned on when a call is received or when the transmitter is activated.

SQUELCH CANCEL
(with sequential tone receiver option)

When the loudspeaker is on the squelch function can be cancelled by keeping the loudspeaker on/off button depressed. If no signal is being received noise will be heard in the loudspeaker.

SQUELCH CANCEL
(without sequential tone receiver option)

The squelch function is cancelled by pressing the loudspeaker on/off button.

TRANSMITTING

Before a call can be transmitted the channel must be free. Any attempt to transmit when the loudspeaker is off and the channel is busy will result in an alarm tone in the loudspeaker as long as the transmit button is depressed.

For radios with sequential tone transmit option a call is initiated by pressing the transmit (PTT) button. A tone call is then transmitted and the

loudspeaker automatically turned on. When the call is answered the transmit button is used for conversation. If the channel is busy the call is not transmitted.

For radios with sequential tone receive option turn the loudspeaker on and press the transmit button when the channel is free.

For radios without tone option wait until the channel is free. Then press the transmit button and speak into the microphone with normal voice.

The transmit indicator will be displayed while transmitting and all button functions will be inhibited.

TONE CALL SWITCHING
(with sequeltial tone transmit option only)

The two tone call select buttons , X10 and X1, are used to select up to 100 different tone calls. The basic tone call format and the position of the selectable tones in the format are part of the personality data programmed into a Programmable Read Only Memory (PROM). Two digits are displayed to show the selected tone call. The X10 and X1 buttons are used to step the digit until the wanted number is displayed.

TONE CALL TRANSMISSION

A sequential tone call can be transmitted using the transmit button when the loudspeaker is off, refer to transmitting.
If the loudspeaker is on a tone call is transmitted by pressing the tone button. During the tone transmission the keyboard is inhibited.

TONE CALL RECEPTION

When a tone call is received the loudspeaker is automatically turned on, the call indicator displayed and an alarm tone sounded for approx. 1 sec. The call indicator is turned off when the transmit button or any other key is pressed.
If the acknowledge facility is present the acknowledge signal is automatically transmitted.

If group call facility is present a group call will automatically turn the loudspeaker on.

Storno

GENERAL DESCRIPTION

CQP4000

STORNOPHONE 4000 is a personal radiotelephone with transmitter, receiver, controls and display, loudspeaker, microphone and battery.
Although being handheld and compact in size the radio can be programmed with two channels and optionally, be equipped with sequential tone encoder/decoder, CTCSS (channel guard) encoder, or CTCSS (channel guard) encoder/decoder.

The mechanical construction of the radio is a screened enclosure in the form of a cast chassis and a metalized plastic front as lid.
A moulded plastic house is attached to the chassis to provide mechanical protection and hold the battery. All controls and indicators are integrated in a keypad/display field on the radio front except for the transmit button which is on the left side of the radio. The electrical circuitry of the radio is built on printed wiring boards: an RF-board containing the transmitter and receiver, a control logic board and, optionally, a thick film tone module.
The RF-board comprises the frequency synthesizer, the transmitter exciter and power amplifier, the receiver RF circuits and IF-circuits, the voltage regulator, and is available in different versions according to frequency band and channel spacing.
The control logic board (CL) comprises the receiver AF amplifier, the transmitter modulation processor, the microcontroller and the display.
The tone module is a thick-film add-on module designed to be plugged into a socket on the CL-board.

ANTENNAS

The CQP4000 is designed for a 50-ohm antenna which is screwed onto the top of the radio. The following types are available:

- a resonant helical antenna, AN4xx1
- a wide band conductive rubber antenna, AN4xx2

BATTERIES

The battery is designed to snap into a compartment at the bottom of the radio and is a selfcontained nickel-cadmium (Ni-Cd) pack.
Two battery packs are available:

- a 450 mA battery, BU4001
- a 750 mA battery, BU4002

CARRYING DEVICES

The following devices are available for carrying the radio:

- a carrying strap in leather with eyelets, CK4003
- two carrying cases in stout leather, CK4004 and CK4005, one for each battery version of the CQP4000
- a belt retainer, CK4006, comprising a bracket to mount on a special plast cabinet CA4002 + a leather ring with a swivel lock.
- a belt clip, CK4007, which must also be mounted together with CA4002

BATTERY TESTER

A battery tester is available for checking the charge condition of batteries. A button on the tester loads the battery and the charge condition is read on a meter scale, SI4001.

OPERATING INSTRUCTIONS

All buttons, except the transmit button, will when pressed respond with an attention tone, approx. 40 ms long, to give the operator an indication of a depressed button.

ON/OFF/DISPLAY LIGHT

When the battery is inserted the radio is turned on by pressing the ON/OFF button. When the radio turns on the display light is on for a short time and the light timer will be reset each time a button is pressed. The radio will be on first used channel and variable tone digits, if used, set to 00. For sets with sequential tone receiver the loudspeaker will be off.
If the tone receiver is not fitted the loudspeaker is always on and the call indicator is not used.

The display light is turned on by pressing the ON/OFF button once.

The radio can only be turned off while the display light is on. To turn off press the ON/OFF button to light the display if not already on and then again press the ON/OFF button. Before the control logic turns the radio off a high pitch tone is sounded for 1 second the volume being independent of the present volume setting.
When the battery is discharged and reach a certain voltage, the radio emits an acoustic alarm tone to inform the operator that the battery has to be replaced. The alarm tone is similar to that emitted when turning the radio off and if the operator does not turn the radio off the control logic will automatically turn off.
The battery condition is monitored only when the radio is in receive mode.

CHANNEL SELECTION

When turned on the radio will be set to first used channel. To select next channel press the channel select button, C.
Channel selection can only take place while in receive mode.

VOLUME SETTING

The loudspeaker volume can be adjusted in steps. There are 8 levels and when the radio is turned on the volume is automatically set to medium.
To increase the volume press V+ and to lower the volume press V-. When the higher or lower limit is reached the volume can not be further adjusted until the opposite button is pressed.
Each time a volume button is pressed the radio emits a short attention tone.

LOUDSPEAKER ON/OFF (MONITOR)

This button and its display symbol is used with sequential tone option only.
With the sequential tone receiver option the loudspeaker is off when the radio is turned on. When the loudspeaker button is pressed the loudspeaker is turned on and the call indicator displayed.
The loudspeaker is automatically turned on when a call is received or when the transmitter is activated.

SQUELCH CANCEL
(with sequential tone receiver option)

When the loudspeaker is on the squelch function can be cancelled by keeping the loudspeaker on/off button depressed. If no signal is being received noise will be heard in the loudspeaker.

SQUELCH CANCEL
(without sequential tone receiver option)

The squelch function is cancelled by pressing the loudspeaker on/off button.

TRANSMITTING

Before a call can be transmitted the channel must be free. Any attempt to transmit when the loud-

speaker is off and the channel is busy will result in an alarm tone in the loudspeaker as long as the transmit button is depressed.

For radios with sequential tone transmit option a call is initiated by pressing the transmit (PTT) button. A tone call is then transmitted and the loudspeaker automatically turned on. When the call is answered the transmit button is used for conversation. If the channel is busy the call is not transmitted.

For radios with sequential tone receive option turn the loudspeaker on and press the transmit button when the channel is free.

For radios without tone option wait until the channel is free. Then press the transmit button and speak into the microphone with normal voice.

The transmit indicator will be displayed while transmitting and all button functions will be inhibited.

TONE CALL SWITCHING
(with sequeltial tone transmit option only)

The two tone call select buttons , X10 and X1, are used to select up to 100 different tone calls.

The basic tone call format and the position of the selectable tones in the format are part of the personality data programmed into a Programmable Read Only Memory (PROM). Two digits are displayed to show the selected tone call. The X10 and X1 buttons are used to step the digit until the wanted number is displayed.

TONE CALL TRANSMISSION

A sequential tone call can be transmitted using the transmit button when the loudspeaker is off, refer to transmitting.
If the loudspeaker is on a tone call is transmitted by pressing the tone button. During the tone transmission the keyboard is inhibited.

TONE CALL RECEPTION

When a tone call is received the loudspeaker is automatically turned on, the call indicator displayed and an alarm tone sounded for approx. 1 sec. The call indicator is turned off when the transmit button or any other key is pressed.
If the acknowledge facility is present the acknowledge signal is automatically transmitted.

If group call facility is present a group call will automatically turn the loudspeaker on.

Storno

MECHANICAL DESCRIPTION

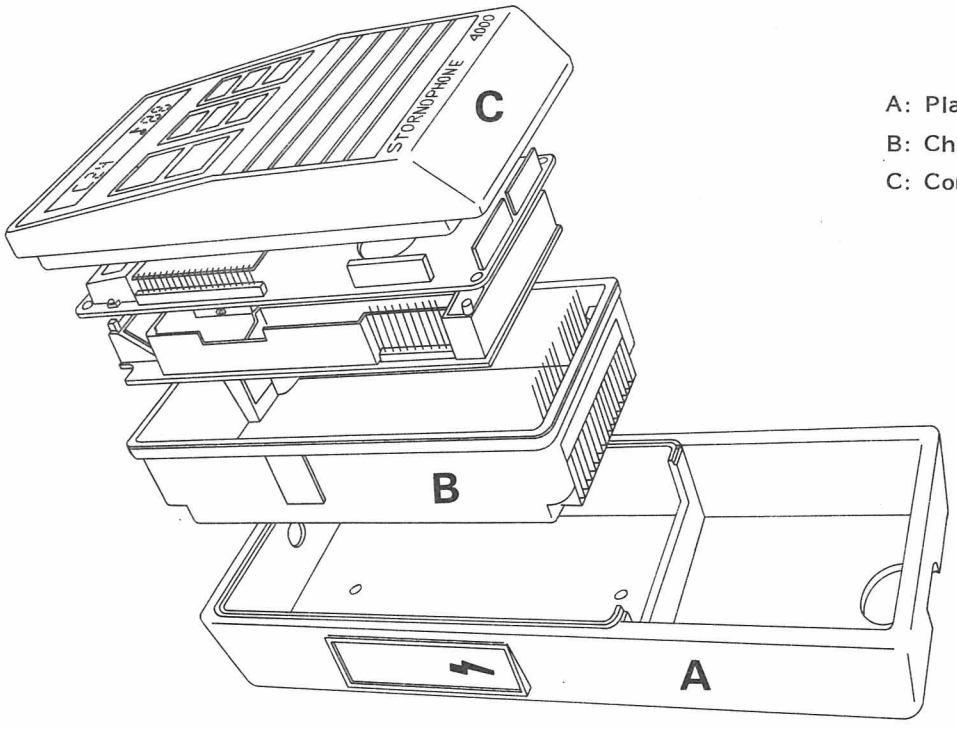
STORNOPHONE 4000

CHASSIS BOX

The chassis box is a tin plated zink casting provided with an antenna socket and a sealing gasket for transmit button which activates a microswitch on the control logic board. The combined battery/test connector is attatched to the chassis and potted for weather protection. Inside the bottom is a plate with fingers pressing against the solder side of the RF-board and thus obtains the necessary ground connections.

The RF and CL boards are kept in position with 4 screws which attatch the chassis box to the front part. In the chassis bottom are two threaded inserts for attatching the rear part of the plastic cover.
The plastic cover has a battery compartment which will accept two types of batteries. The battery snaps into position by means of a moulded contour on the inner side of the compartment wall. The battery is released by pressing through a hole in the rear wall.

An 18-position battery and test connector is placed inside the battery compartment. 5 of the connector pins are used for connection to the battery. The others are used for automatic or manual testing.



A: Plastic cover
B: Chassis box
C: Control Panel Front

CIRCUIT DESCRIPTION

CQP4xxx

RECEIVER

The receiver is a dual conversion superheterodyne receiver with a first IF of 21.4 MHz and second IF of 455 kHz. All receiver circuitry except the AF amplifier is placed on the RF board.

RECEIVER FRONT END

The receiver front-end consists of a 2-resonator input filter, an RF amplifier, a 2-resonator intermediate filter and a mixer.

IF AND DEMODULATOR

The mixer output is fed through a matching circuit to the crystal filter.
The crystal filter output is fed to the dual gate MOSFET which overcomes the noise figure of the following stages and provides constant load to the crystal filter.

The following integrated circuit includes crystal oscillator and active mixer, second IF amplifier, quadrature discriminator and schmitt trigger for squelch.

SQUELCH

The squelch circuit is a separate thick film module. The AF signal from the quadrature detector is fed to an active high-pass filter where noise above 7 kHz is extracted.
Via the squelch potentiometer, adjusted for 10-12 dB SINAD, the signal is fed to an amplifier to obtain the right level for the detector.

The detector output is connected to the schmitt-trigger, part of the preamplifier circuit, which gives the necessary hysteresis and well-defined output signal.

PREAMPLIFIER

The last stage of the IF integrated circuit is an AF preamplifier. Its output can be adjusted to 110 mV by a potentiometer.

AUDIO AMPLIFIER

The line level of the AF preamplifier is fed to the audio amplifier situated on the CL board (see the chapter about CL description).

TRANSMITTER

The transmitter consists of an exciter and a power amplifier.
The VCO (voltage controlled oscillator) drives the exciter directly. The exciter contains wide-band stages and delivers input to the power amplifier. All stages, including the VCO operate at carrier frequency.
The power amplifier includes the output stage, a low-pass filter and a power control circuit.
The power amplifier is connected to the low-pass filter via a diode antenna switch.

EXCITER

In the exciter, the VCO signal, 1 mV is amplified to 0.5 Watt.
The exciter consists of three wide band stages covering the whole band. The RF bandwidth is limited by the VCO.
The exciter needs no adjustment.

POWER AMPLIFIER

The power amplifier consists of a single broadband stage.
The antenna is matched to the power amplifier by tuning the antenna or by using a wide band antenna.

A power control circuit protects the RF output from temperature or voltage variations and keeps it relatively constant.
The output power level can be set with a potentiometer over a 2:1 range.

TX AUDIO PROCESSOR

The modulation signal is delivered from the TX audio processor situated on the CL board (see chapter of CL description).

WARNING: The transmitter PA-transistors contain Beryllium. It is dangerous to cut, to file or to dissed those transistors because the beryllium oxide is poisonous when absorbed.

FREQUENCY SYNTHESIZER

The frequency synthesizer circuits are:
- Prescaler
- PLL unit
- Ref. crystal oscillator
- TX and RX VCO (voltage controlled oscillator)
- Save switch

PRESCALER

The prescaler is a high speed counter which divides by a fixed ratio: P
Under control of the PLL circuit, it can be set to divide by the fixed ratio plus one: P+1
The prescaler has a low power consumption from 4 to 7 mA.

PLL AND ASSOCIATED CIRCUITS

The circuitry consist of:
- three programmable dividers
- control logic for the prescaler
- phase detector with lock detector

1. The R divider divides the output of the crystal oscillator in order to give channel spacing. Its output is fed into the phase detector.

2. The N divider divides the output of the prescaler. The ratio stored in the N divider must be the one giving N output equal R output. Its output is fed into the phase detector.

3. The A divider is controlled by the control logic. The ratio of the A divider makes the prescaler divide by P+1 if necessary. The A divider can not start with a zero.

4. The phase detector compares the outputs of the R and the N divider.
   The phase/lock detector two outputs are:
   - out of lock/lock signal to the CL board, indication whether or not the two inputs (R and N outputs) are equal.
   - DC level controlling the VCO through a band-pass filter and a save switch.

REFERENCE CRYSTAL OSCILLATOR

This crystal oscillator supplies clock signals to the microprocessor on the CL board and gives the reference frequency to the PLL circuit through the R divider.

TX AND RX VCO

The voltage controlled oscillator (VCO) is a FET oscillator. The frequency is controlled by two varicaps, one in the RX VCO circuit and one in the TX VCO circuit. The varicaps DC voltage is delivered from the PLL circuit.
The TX VCO contains another varicap used for frequency modulation. The modulation signal comes from the microphone amplifier placed on the CL board.
As buffer between the VCO and the PLL circuits, the following circuits are used:

- the mixer injection buffer for the RX VCO
- the exciter for the TX VCO

SAVE SWITCH

In order to reduce power consumption in standby, the save circuits disconnects:

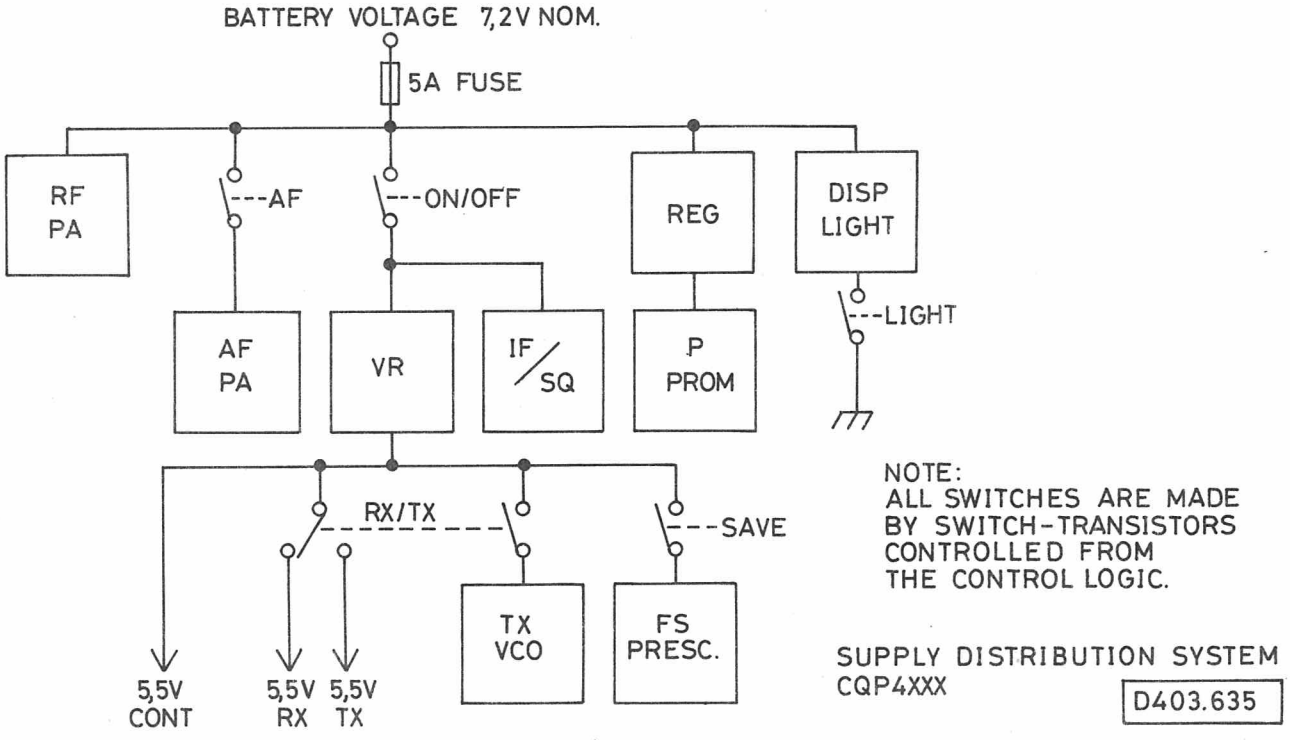
- DC control level to the VCO
- power to the prescaler

The save circuit is controlled by the microprocessor from the CL board.
It is not connected to TX VCO.

POWER SUPPLY

The 7.2 V battery voltage is distribuated for different purposes through a 5 A fuse:

- directly to the RF power amplifier
- to the audio output amplifier through a switch transistor
- to the IF/squelch circuits and the 5.5 V voltage regulator through the on/off switch transistor
- to the personality PROM through a separate regulator
- to the LED's for the LCD display-back-light.



BATTERY OPERATING TIME

Transmit	Receive	Standby	Tone Equip.	Operation			
				2 W PA		1 W PA	
				BU4001	BU4002	BU4001	BU4002
5%	5%	90%	YES	6.3 h	10.4 h	7.4 h	12.3 h
2%	5%	93%	YES	9.8 h	16.4 h	10.8 h	18.1 h
5%	25%	70%	NO	5.3 h	8.7 h	6.1 h	10.0 h
2%	25%	73%	NO	7.6 h	12.6 h	8.2 h	13.6 h

VOLTAGE REGULATOR

A 5.5 V stabilized voltage regulator is designed around an adjustable shunt regulator IC, with low drop-out voltage, high temperature stability and short circuit protection.
Regulated 5.5 V is continuously applied to the IF-squelch and synthesizer circuits, to the RX/TX switch-circuit controlled by the control logic, and through a current save switch to the pre-scaler in the RF synthesizer.

The RX/TX switching is performed, where possible, by switching only the bias currents to the involved circuits.

GENERAL DESCRIPTION

CQP4000

STORNOPHONE 4000 is a personal radiotelephone with transmitter, receiver, controls and display, loudspeaker, microphone and battery.
Although being handheld and compact in size the radio can be programmed with up to 10 channels and optionally, be equipped with sequential tone encoder/decoder, CTCSS (channel guard) encoder, or CTCSS (channel guard) encoder/decoder.

The mechanical construction of the radio is a screened enclosure in the form of a cast chassis and a metalized plastic front as lid.
A moulded plastic house is attached to the chassis to provide mechanical protection and hold the battery. All controls and indicators are integrated in a keypad/display field on the radio front except for the transmit button which is on the left side of the radio. The electrical circuitry of the radio is built on printed wiring boards: an RF-board containing the transmitter and receiver, a control logic board and, optionally, a thick film tone module.
The RF-board comprises the frequency synthesizer, the transmitter exciter and power amplifier, the receiver RF circuits and IF-circuits, the voltage regulator, and is available in different versions according to frequency band and channel spacing.
The control logic board (CL) comprises the receiver AF amplifier, the transmitter modulation processor, the microcontroller and the display.
The tone module is a thick-film add-on module designed to be plugged into a socket on the CL-board.

ANTENNAS

The CQP4000 is designed for a 50-ohm antenna which is screwed onto the top of the radio. The following types are available:

- a preadjusted resonant helical antenna, AN4xx3
- a wide band conductive rubber antenna, AN4xx2
- a whip antenna, AN4661

BATTERIES

The battery is designed to snap into a compartment at the bottom of the radio and is a selfcontained nickel-cadmium (Ni-Cd) pack.
Two battery packs are available:

- a 450 mA battery, BU4001
- a 750 mA battery, BU4002

CARRYING DEVICES

The following devices are available for carrying the radio:

- a carrying strap in leather with eyelets, CK4003
- two carrying cases in stout leather, CK4004 and CK4005, one for each battery version of the CQP4000
- a belt retainer, CK4006, comprising a bracket to mount on a special plast cabinet CA4002/CA4004 + a leather ring with a swivel lock.
- a belt clip, CK4007, which must also be mounted together with CA4002/CA4004.

BATTERY TESTER

A battery tester is available for checking the charge condition of batteries. A button on the tester loads the battery and the charge condition is read on a meter scale, SI4001.

OPERATING INSTRUCTIONS

All buttons, except the transmit button, will when pressed respond with an attention tone, approx. 40 ms long, to give the operator an indication of a depressed button.

ON/OFF/DISPLAY LIGHT

When the battery is inserted the radio is turned on by pressing the ON/OFF button. When the radio turns on the display light is on for a short time and the light timer will be reset each time a button is pressed. The radio will be on first used channel and variable tone digits, if used, set to 00. For sets with sequential tone receiver the loudspeaker will be off.
If the tone receiver is not fitted the loudspeaker is always on and the call indicator is not used.

The display light is turned on by pressing the ON/OFF button once.

The radio can only be turned off while the display light is on. To turn off press the ON/OFF button to light the display if not already on and then again press the ON/OFF button. Before the control logic turns the radio off a high pitch tone is sounded for 1 second the volume being independent of the present volume setting.
When the battery is discharged and reach a certain voltage, the radio emits an acoustic alarm tone to inform the operator that the battery has to be replaced. The alarm tone is similar to that emitted when turning the radio off and if the operator does not turn the radio off the control logic will automatically turn off.
The battery condition is monitored only when the radio is in receive mode.

CHANNEL SELECTION

When turned on the radio will be set to first used channel. To select next channel press the channel select button, C.
Channel selection can only take place while in receive mode.

VOLUME SETTING

The loudspeaker volume can be adjusted in steps. There are 8 levels and when the radio is turned on the volume is automatically set to medium.
To increase the volume press V+ and to lower the volume press V-. When the higher or lower limit is reached the volume can not be further adjusted until the opposite button is pressed.
Each time a volume button is pressed the radio emits a short attention tone.

LOUDSPEAKER ON/OFF (MONITOR)

This button and its display symbol is used with sequential tone option only.
With the sequential tone receiver option the loudspeaker is off when the radio is turned on. When the loudspeaker button is pressed the loudspeaker is turned on and the call indicator displayed.
The loudspeaker is automatically turned on when a call is received or when the transmitter is activated.

SQUELCH CANCEL
(with sequential tone receiver option)

When the loudspeaker is on the squelch function can be cancelled by keeping the loudspeaker on/off button depressed. If no signal is being received noise will be heard in the loudspeaker.

SQUELCH CANCEL
(without sequential tone receiver option)

The squelch function is cancelled by pressing the loudspeaker on/off button.

TRANSMITTING

Before a call can be transmitted the channel must be free. Any attempt to transmit when the loud-

speaker is off and the channel is busy will result in an alarm tone in the loudspeaker as long as the transmit button is depressed.

For radios with sequential tone transmit option a call is initiated by pressing the transmit (PTT) button. A tone call is then transmitted and the loudspeaker automatically turned on. When the call is answered the transmit button is used for conversation. If the channel is busy the call is not transmitted.

For radios with sequential tone receive option turn the loudspeaker on and press the transmit button when the channel is free.

For radios without tone option wait until the channel is free. Then press the transmit button and speak into the microphone with normal voice.

The transmit indicator will be displayed while transmitting and all button functions will be inhibited.

TONE CALL SWITCHING
(with sequeltial tone transmit option only)

The two tone call select buttons , X10 and X1, are used to select up to 100 different tone calls.

The basic tone call format and the position of the selectable tones in the format are part of the personality data programmed into a Programmable Read Only Memory (PROM). Two digits are displayed to show the selected tone call. The X10 and X1 buttons are used to step the digit until the wanted number is displayed.

TONE CALL TRANSMISSION

A sequential tone call can be transmitted using the transmit button when the loudspeaker is off, refer to transmitting.
If the loudspeaker is on a tone call is transmitted by pressing the tone button. During the tone transmission the keyboard is inhibited.

TONE CALL RECEPTION

When a tone call is received the loudspeaker is automatically turned on, the call indicator displayed and an alarm tone sounded for approx. 1 sec. The call indicator is turned off when the transmit button or any other key is pressed.
If the acknowledge facility is present the acknowledge signal is automatically transmitted.

If group call facility is present a group call will automatically turn the loudspeaker on.

GENERAL DESCRIPTION

CQP4000 AUTOMATIC/BINARY

The CQP4000 Automatic is a personal radiotelephone with transmitter, receiver, controls and display, loudspeaker, microphone and battery.
Although being handheld and compact in size the radio can be programmed with up to 99 channels and equipped with tone facility.

The mechanical construction of the radio is a screened enclosure in the form of a cast chassis and a metallized plastic front as lid.
A moulded plastic house is attached to the chassis to provide mechanical protection and hold the battery. All controls and indicators are integrated in a keypad/display field on the radio front except for the transmit button which is on the left side of the radio. The electrical circuitry of the radio is built on printed wiring boards: an RF-board containing the transmitter and receiver, a control logic board and a thick film tone module.

The RF-board comprises the frequency synthesizer, the transmitter exciter and power amplifier, the receiver RF circuits and IF-circuits, the voltage regulator, and is available in different versions according to frequency band and channel spacing.

The control logic board (CL) comprises the receiver AF amplifier, the transmitter modulation processor, the microcontroller sub-module PU4001 and the display.
The tone module is a thick-film add-on module designed to be plugged into a socket on the CL-board.

ANTENNAS

The CQP4000 is designed for a 50-ohm antenna which is screwed onto the top of the radio. The following types are available:

- a resonant helical antenna, AN4xx1
- a wide band conductive rubber antenna, AN4xx2

BATTERIES

The battery is designed to snap into a compartment at the bottom of the radio and is a selfcontained nickel-cadmium (Ni-Cd) pack.
Two battery packs are available:

- a 450 mA battery, BU4001
- a 750 mA battery, BU4002

The CQP4000 Automatic version is furthermore fitted with a lithium battery which serves as back-up for the microcontroller's data memory. Estimated minimum lifetime of this battery is 3 years.

CARRYING DEVICES

The following devices are available for carrying the radio:

- a carrying strap in leather with eyelets, CK4003
- two carrying cases in stout leather, CK4004 and CK4005, one for each battery version of the CQP4000
- a belt retainer, CK4006, comprising a bracket to mount on a special plast cabinet CA4002/CA4004 + a leather ring with a swivel lock.
- a belt clip, CK4007, which must also be mounted together with CA4002/CA4004
- a leather carrying case, CK4008, with cut-aways for multiconnector
- a leather carrying case, CK4009, with cut-aways for multiconnector intended for BU4002 application

REMOTE CONTROLS

Three different remote control boxes are available. They are used in conjunction with a special cabinet, CA4003, and a special chassis, CH4003. The control boxes differ from one another only on the basis of a "special functions button".

- CB4001 has no extra push button
- CB4002 has one extra push button either for control of tone keying or LS ON/OFF
- CB4003 has two extra push buttons, one for the tone key and one for LS ON/OFF.

BATTERY TESTER

A battery tester is available for checking the chargeing condition of batteries. A button on the tester loads the battery and the charge condition is read on a meter scale, SI4001.

Storno

MECHANICAL DESCRIPTION

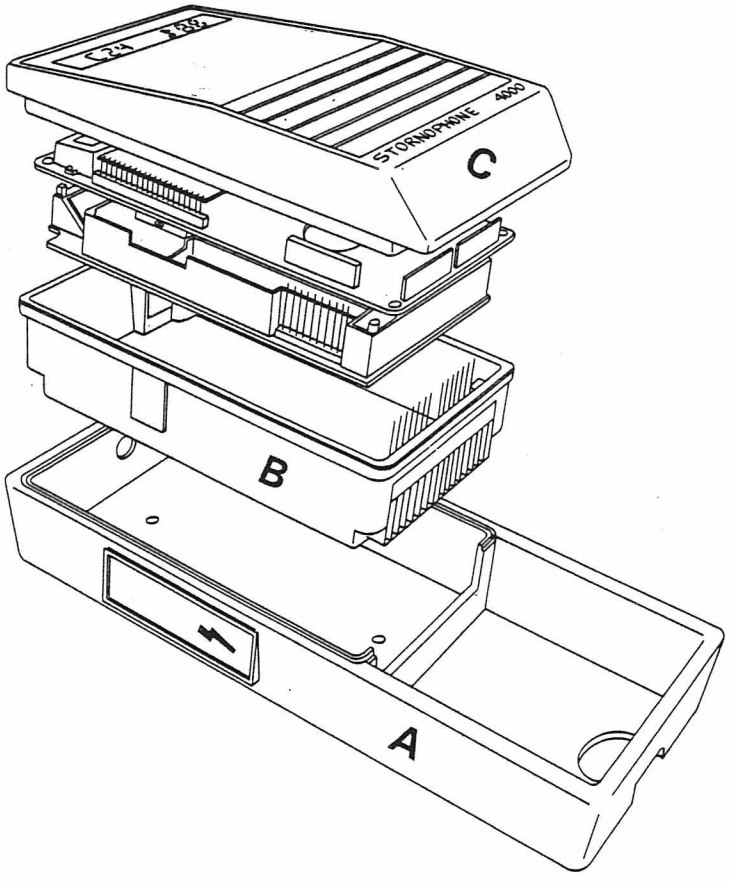
CQP4000 AUTOMATIC/BINARY

CHASSIS BOX

The chassis box is a tin plated zink casting provided with an antenna socket and a sealing gasket for transmit button which activates a microswitch on the control logic board. The combined battery/test connector is attatched to the chassis and potted for weather protection. Inside the bottom is a plate with fingers pressing against the solder side of the RF-board and thus obtains the necessary ground connections.

The RF and CL boards are kept in position with 4 screws which attatch the chassis box to the front part. In the chassis bottom are two threaded inserts for attatching the rear part of the plastic cover.
The plastic cover has a battery compartment which will accept two types of batteries. The battery snaps into position by means of a moulded contour on the inner side of the compartment wall. The battery is released by pressing through a hole in the rear wall.

An 18-position battery and test connector is placed inside the battery compartment. 5 of the connector pins are used for connection to the battery. The others are used for automatic or manual testing.



A: Plastic cover
B: Chassis box
C: Control Panel Front

MECHANICAL DESCRIPTION

CQP4000 AUTOMATIC

CHASSIS BOX

The chassis box is a tin plated zink casting provided with an antenna socket and a sealing gasket for transmit button which activates a microswitch on the control logic board. The combined battery/test connector is attatched to the chassis and potted for weather protection. Inside the bottom is a plate with fingers pressing against the solder side of the RF-board and thus obtains the necessary ground connections.

The RF and CL boards are kept in position with 4 screws which attatch the chassis box to the front part. In the chassis bottom are two threaded inserts for attatching the rear part of the plastic cover.
The plastic cover has a battery compartment which will accept two types of batteries. The battery snaps into position by means of a moulded contour on the inner side of the compartment wall. The battery is released by pressing through a hole in the rear wall.

An 18-position battery and test connector is placed inside the battery compartment. 5 of the connector pins are used for connection to the battery. The others are used for automatic or manual testing.

C: Control Panel Front

CIRCUIT DESCRIPTION

- General for all RF boards

CIRCUIT DESCRIPTION

CQP4xxx

RECEIVER

The receiver is a dual conversion superheterodyne receiver with a first IF of 21.4 MHz (45 MHz for RF4774) and second IF of 455 kHz. All receiver circuitry except the AF amplifier is placed on the RF board.

RECEIVER FRONT END

The receiver front-end consists of a 2-resonator input filter, an RF amplifier, a 2-resonator intermediate filter and a mixer.

IF AND DEMODULATOR

The mixer output is fed through a matching circuit to the crystal filter.
The crystal filter output is fed to the dual gate MOSFET which overcomes the noise figure of the following stages and provides constant load to the crystal filter.

The following integrated circuit includes crystal oscillator and active mixer, second IF amplifier, quadrature discriminator and schmitt trigger for squelch.

SQUELCH

The squelch circuit is a separate thick film module. The AF signal from the quadrature detector is fed to an active high-pass filter where noise above 7 kHz is extracted.
Via the squelch potentiometer, adjusted for 10-12 dB SINAD, the signal is fed to an amplifier to obtain the right level for the detector.

The detector output is connected to the schmitt-trigger, part of the preamplifier circuit, which gives the necessary hysteresis and well-defined output signal.

PREAMPLIFIER

The last stage of the IF integrated circuit is an AF preamplifier. Its output can be adjusted to 110 mV by a potentiometer.

AUDIO AMPLIFIER

The line level of the AF preamplifier is fed to the audio amplifier situated on the CL board (see the chapter about CL description).

TRANSMITTER

The transmitter consists of an exciter and a power amplifier.
The VCO (voltage controlled oscillator) drives the exciter directly. The exciter contains wideband stages and delivers input to the power amplifier. All stages, including the VCO operate at carrier frequency.
The power amplifier includes the output stage, a low-pass filter and a power control circuit.
The power amplifier is connected to the low-pass filter via a diode antenna switch.

EXCITER

In the exciter, the VCO signal, 1 mV is amplified to 0.5 Watt.
The exciter consists of three wide band stages covering the whole band. The RF bandwidth is limited by the VCO.
The exciter needs no adjustment.

POWER AMPLIFIER

The power amplifier consists of a single broadband stage.
The antenna is matched to the power amplifier by tuning the antenna or by using a wide band antenna.

A power control circuit protects the RF output from temperature or voltage variations and keeps it relatively constant.
The output power level can be set with a potentiometer over a 2:1 range.

TX AUDIO PROCESSOR

The modulation signal is delivered from the TX audio processor situated on the CL board (see chapter of CL description).

WARNING: The transmitter PA-transistors contain Beryllium. It is dangerous to cut, to file or to dissed those transistors because the beryllium oxide is poisonous when absorbed.

FREQUENCY SYNTHESIZER

The frequency synthesizer circuits are:
- Prescaler
- PLL unit
- Ref. crystal oscillator
- TX and RX VCO (voltage controlled oscillator)
- Save switch

PRESCALER

The prescaler is a high speed counter which divides by a fixed ratio: P
Under control of the PLL circuit, it can be set to divide by the fixed ratio plus one: P+1
The prescaler has a low power consumption from 4 to 7 mA.

PLL AND ASSOCIATED CIRCUITS

The circuitry consist of:
- three programmable dividers
- control logic for the prescaler
- phase detector with lock detector

1. The R divider divides the output of the crystal oscillator in order to give channel spacing. Its output is fed into the phase detector.

2. The N divider divides the output of the prescaler. The ratio stored in the N divider must be the one giving N output equal R output. Its output is fed into the phase detector.

3. The A divider is controlled by the control logic. The ratio of the A divider makes the prescaler divide by P+1 if necessary. The A divider can not start with a zero.

4. The phase detector compares the outputs of the R and the N divider.
   The phase/lock detector two outputs are:
   - out of lock/lock signal to the CL board, indication whether or not the two inputs (R and N outputs) are equal.
   - DC level controlling the VCO through a band-pass filter and a save switch.

REFERENCE CRYSTAL OSCILLATOR

This crystal oscillator supplies clock signals to the microprocessor on the CL board and gives the reference frequency to the PLL circuit through the R divider.

TX AND RX VCO

The voltage controlled oscillator (VCO) is a FET oscillator. The frequency is controlled by two varicaps, one in the RX VCO circuit and one in the TX VCO circuit. The varicaps DC voltage is delivered from the PLL circuit.
The TX VCO contains another varicap used for frequency modulation. The modulation signal comes from the microphone amplifier placed on the CL board.
As buffer between the VCO and the PLL circuits, the following circuits are used:

- the mixer injection buffer for the RX VCO
- the exciter for the TX VCO

SAVE SWITCH

In order to reduce power consumption in standby, the save circuits disconnects:

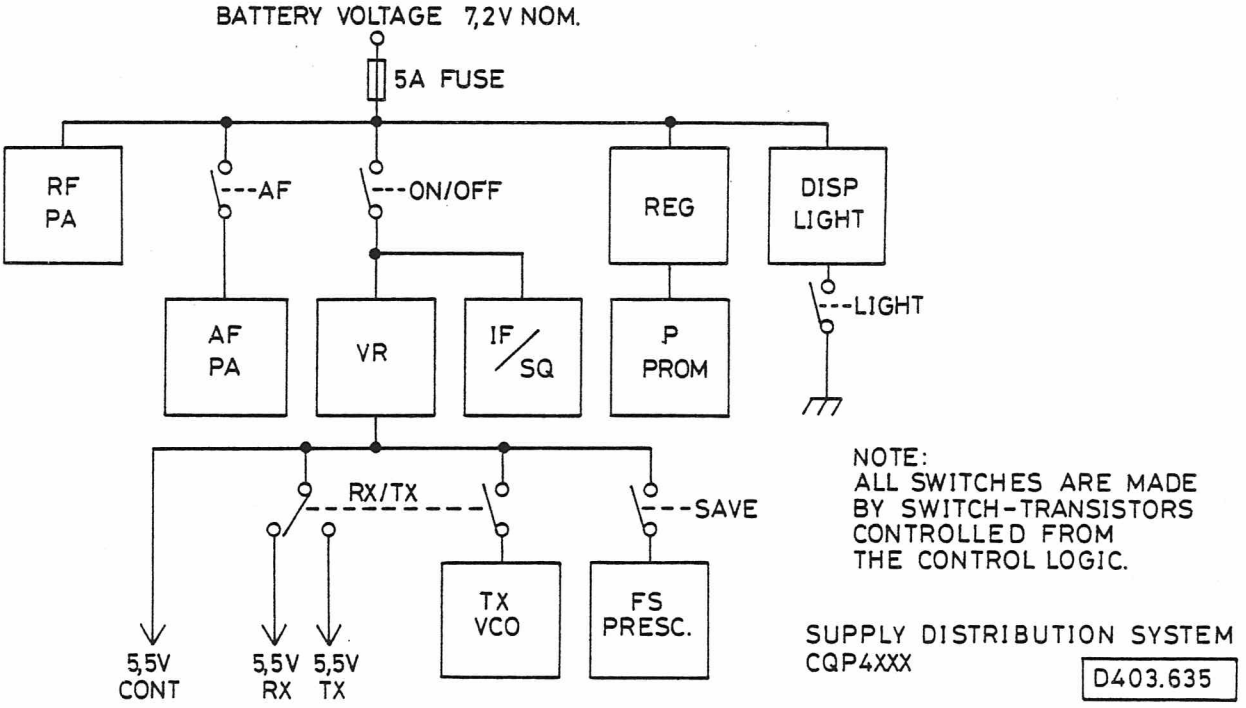
- DC control level to the VCO
- power to the prescaler

The save circuit is controlled by the microprocessor from the CL board.
It is not connected to TX VCO.
This function does not exist in the 200 MHz RF4774 radio set.

POWER SUPPLY

The 7.2 V battery voltage is distribuated for different purposes through a 5 A fuse:

- directly to the RF power amplifier
- to the audio output amplifier through a switch transistor
- to the IF/squelch circuits and the 5.5 V voltage regulator through the on/off switch transistor
- to the personality PROM through a separate regulator
- to the LED's for the LCD display-back-light.



SUPPLY DISTRIBUTION SYSTEM

VOLTAGE REGULATOR

A 5.5 V stabilized voltage regulator is designed around an adjustable shunt regulator IC, with low drop-out voltage, high temperature stability and short circuit protection.
Regulated 5.5 V is continuously applied to the IF-squelch and synthesizer circuits, to the RX/TX switch-circuit controlled by the control logic, and through a current save switch to the pre-scaler in the RF synthesizer.

The RX/TX switching is performed, where possible, by switching only the bias currents to the involved circuits.

ADJUSTMENT PROCEDURE

TEST POINTS AND ADJUSTABLE COMPONENTS
CL - board
RF BOARD RF4110

Storno

ADJUSTMENT PROCEDURE

CQP4110

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4112: 146-174 MHz - 25 kHz channel spacing
CQP4113: 146-174 MHz - 20 kHz channel spacing
CQP4114: 146-174 MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4110:

RF Signal Generator	146-174 MHz
AF Voltmeter	Z_i >0.5 Mohm
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	$Z_{out} \geq$600 ohm
Frequency counter	5-200 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1
Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

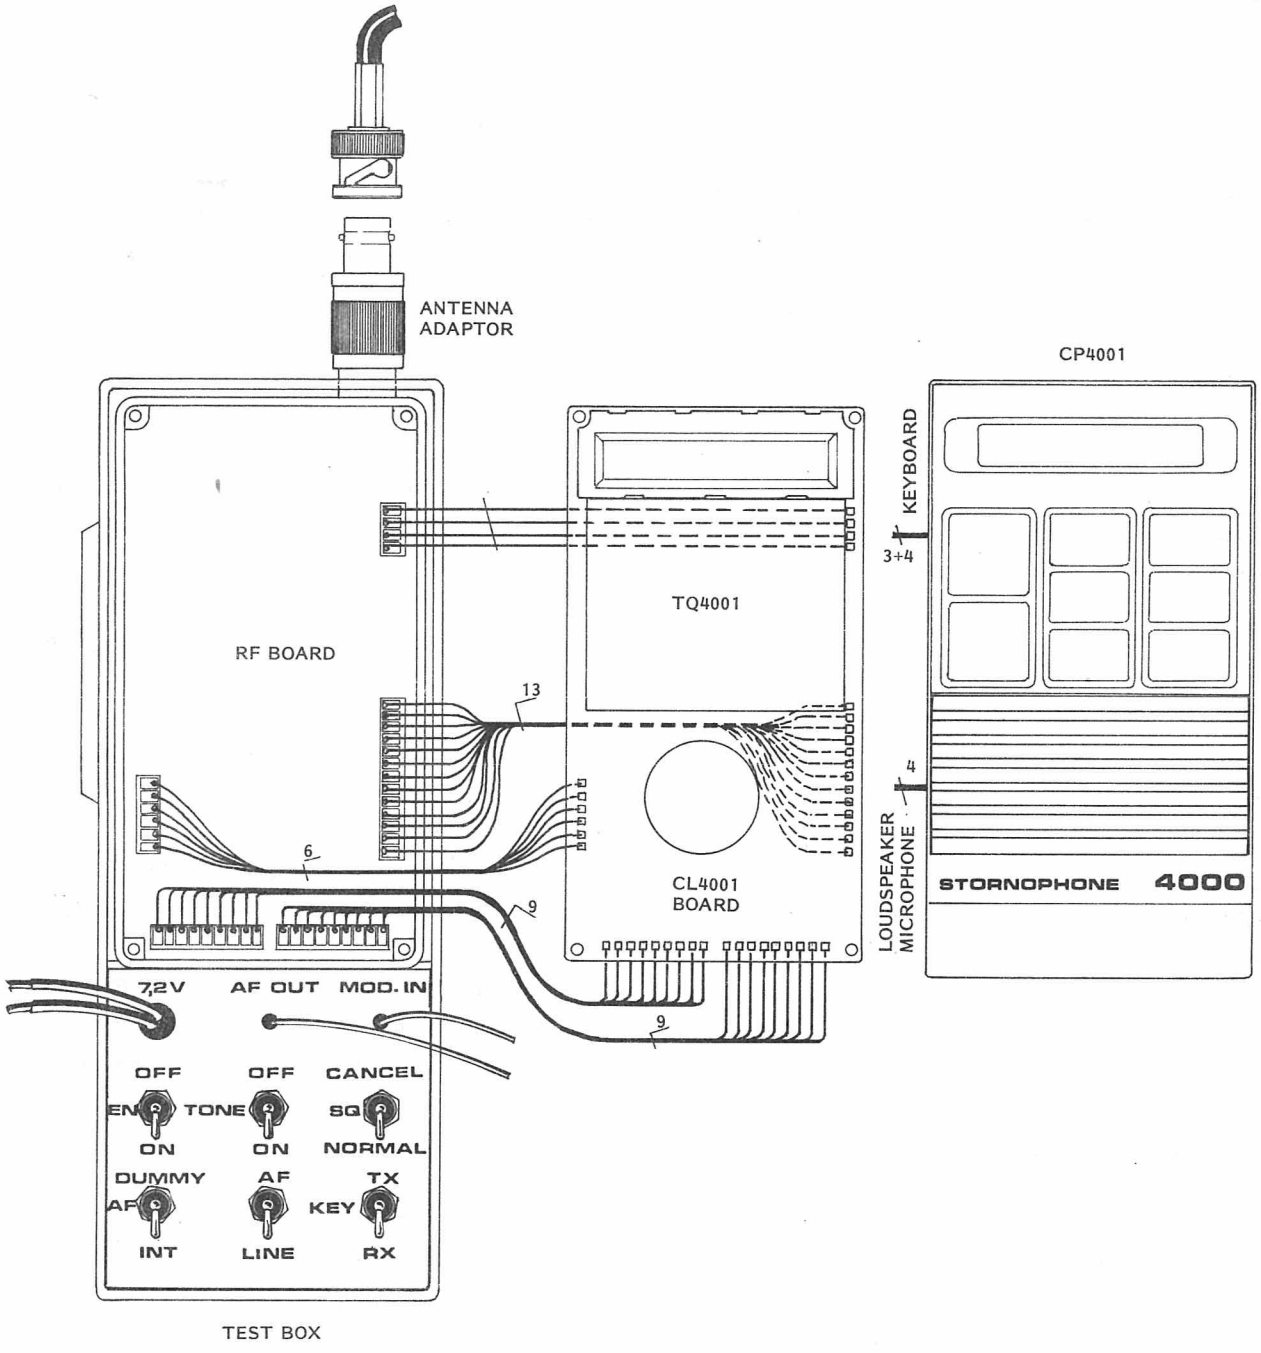
Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
- Take the CL4001 board and the RF4110 board apart.
- Connect the CL4001 board to the RF4110 board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.
Set the power supply voltage to 7.2 V.
Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.
Connect the voltmeter to the +5.5 V test point.
Read the 5.5 V regulated voltage.



TEST SETUP
STORNOPHONE 4000

D403.279

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13-CLOCK.
Read the reference frequency.
Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).
Adjust C533 for f_{nom} ±10 Hz.

Note:
The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.
Key the transmitter and read the current drain.
Requirement: less than 1 A.
Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Adjust C504 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.

Adjust C504 for a reading of 3 Volts. For radios with 2 channels adjust C504 so that the reading for each channel is inside the tuning range, 1-5 V. The channel with the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Connect the wattmeter to the antenna connector.
Adjust ADC potentiometer R115 for rated output power according to the type designation.
Note:
The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.
Connect the frequency counter to the signal sampler.
Key the transmitter and read the frequency.
Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).
Requirement: F_{nom} ±0.2 ppm (30 Hz at 150 MHz)
Deenergize the transmitter.
Select channel 2, if used.
Key the transmitter and check for correct output frequency.

NOTE:
Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Connect the deviation meter to the signal sampler.
Connect the AF generator to MOD IN on the test box.
Set the AF generator frequency to 1000 Hz and the output as follows:
1100 mV with test box (10:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

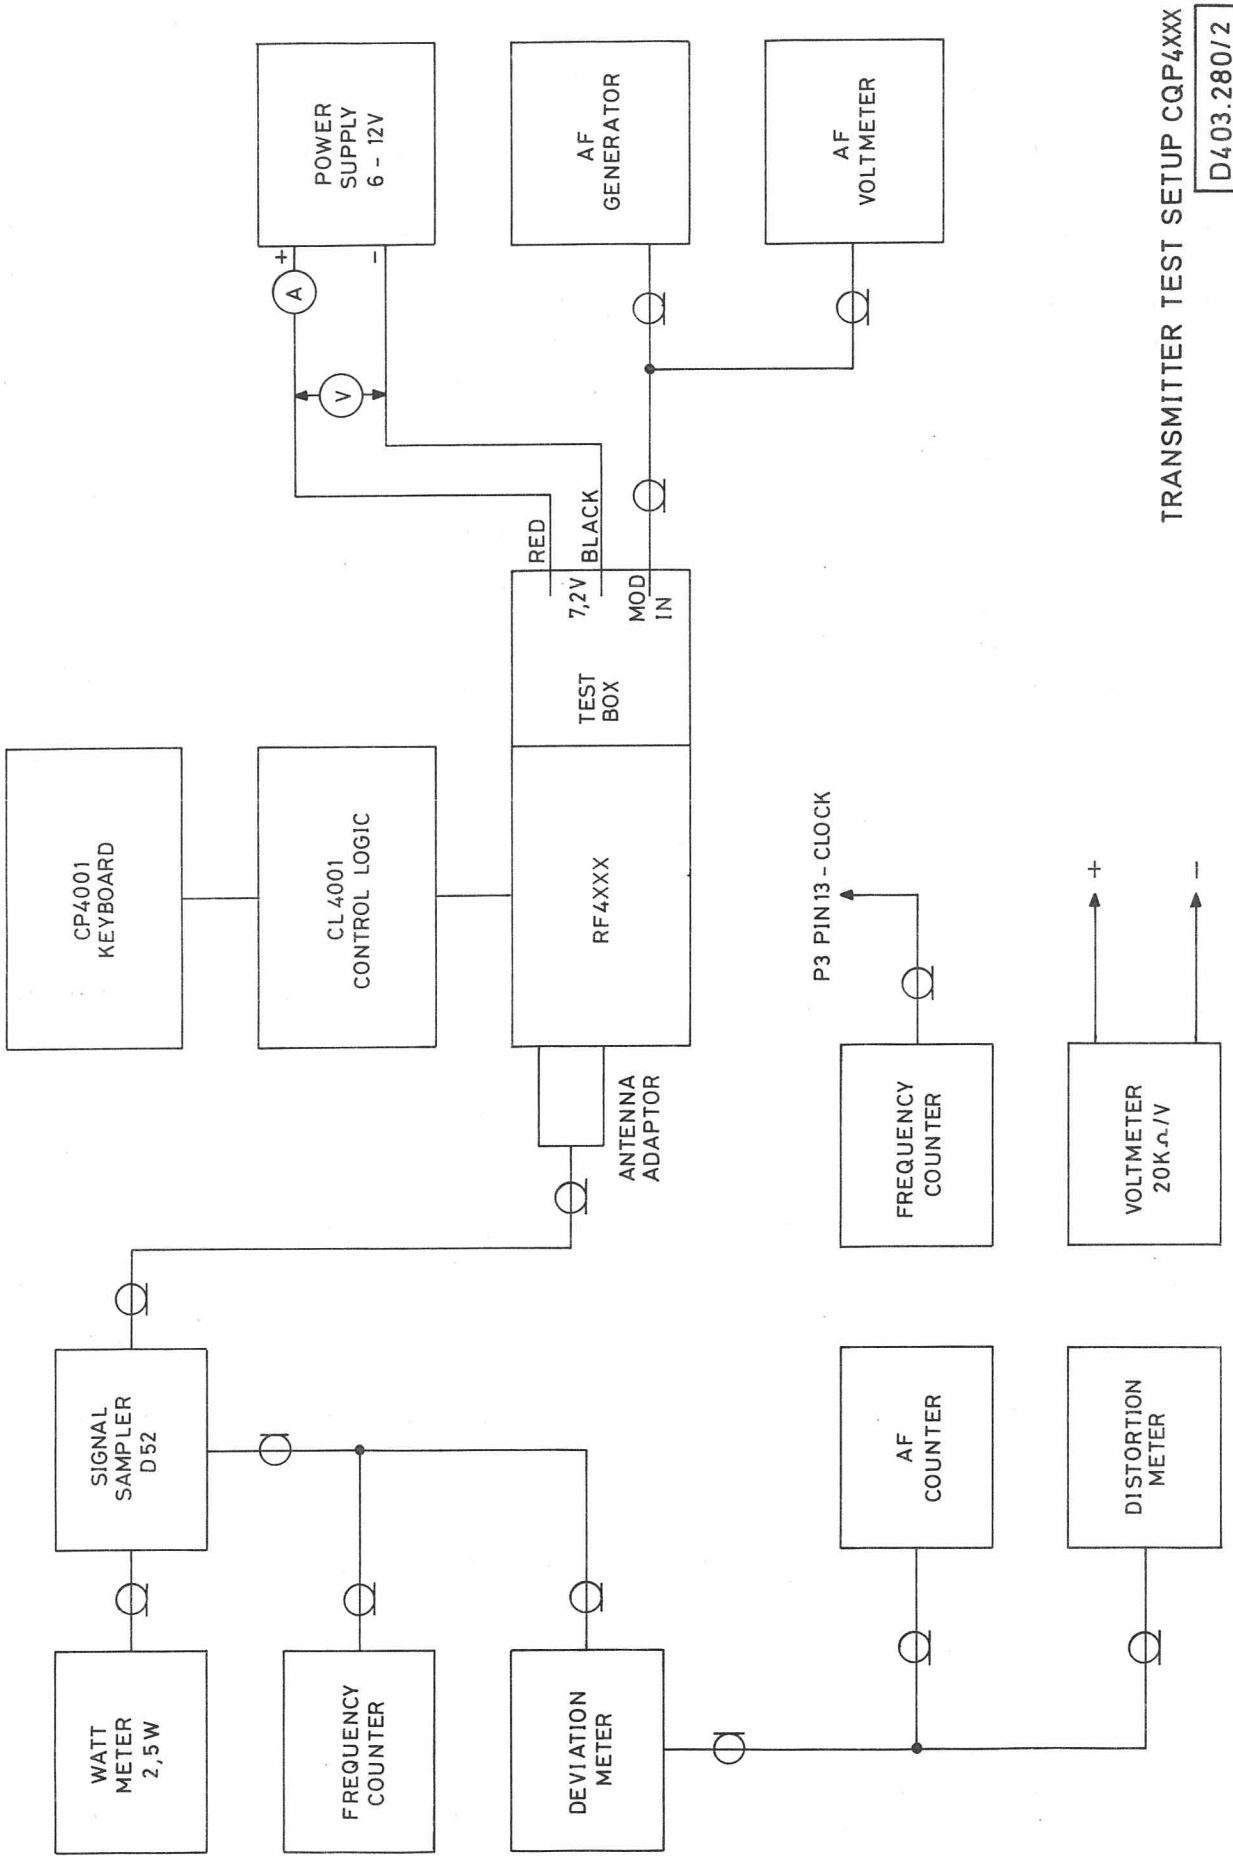
CQP4112: ±5 kHz
CQP4113: ±4 kHz
CQP4114: ±2.5 kHz

Set the AF generator frequency to 1000 Hz.
Reduce the AF generator output until a deviation of 0.7 x maximum deviation is obtained:

CQP4112: ±3.5 kHz
CQP4113: ±2.8 kHz
CQP4114: ±1.75 kHz

Typical generator output is 100 mV.

TRANSMITTER TEST SETUP CQP4XXX D403.280/2



RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Preset coil L508 as follows:
High end of band: 2/3 out of coil.
Low end of band: Fully down in coil form.
Set SQ switch to cancel.
Adjust C514 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.
Adjust C514 for a reading of 3 Volts. For radios with 2 channels adjust C514 so that the reading for each channel is inside the tuning range, 1-5 V. The channel with the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.
Adjust L508 for maximum voltmeter reading, 0.2 V ±0.1 V. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel frequency.

Modulate the signal generator with 1000 Hz to 0.7 x maximum system deviation.
CQP4112: ±3.5 kHz
CQP4113: ±2.8 kHz
CQP4114: ±1.75 kHz

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.
Reduce the signal generator output until voltage reading is less than 1 V.

Adjust L402 and L308 for maximum voltmeter reading.
Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.
Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE
Connect the distortion meter to AF OUT.
Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14.
Set signal generator as described in paragraph 3.
Adjust R409 for a voltmeter reading of 110 mV ±5 mV.

5. FRONT-END ADJUSTMENT

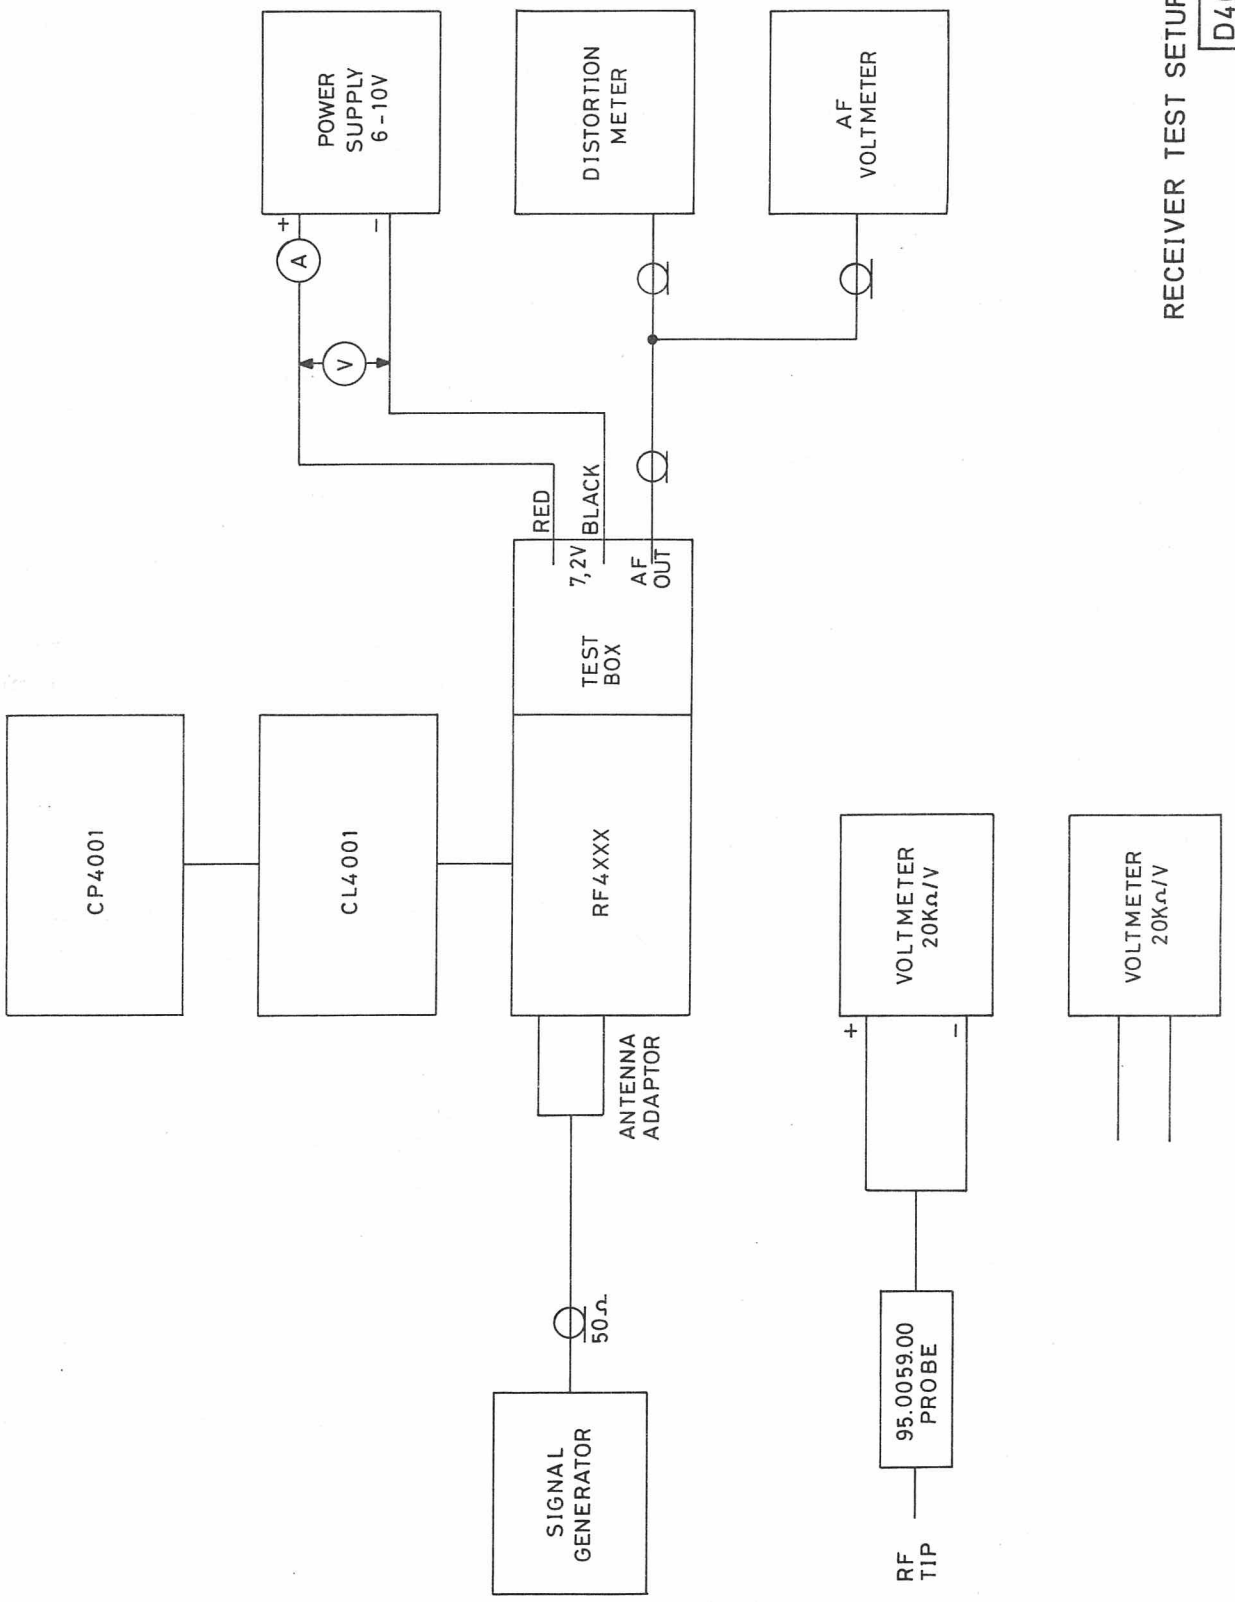
Connect the signal generator to the antenna connector and set its frequency to the channel frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.
Connect a distortion meter to AF OUT.
Set the LS-LINE switch on the test box to LINE.
Set the SQ switch to cancel.

Adjust the following coils for minimum distortion. L306, L305, L303, L302 and L508.
As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.

RECEIVER TEST SETUP CQP4XXX D403.281/2



Check the 12 dB SINAD on both channels, if used.
Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.
Open squelch by setting SQ switch to cancel.

Set the signal generator output to the value giving 12 dB SINAD.
Close squelch by setting SQ switch to normal.
Slowly turn R420 clockwise to the point where the squelch just opens.
Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD
Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.
Turn the radio off and remove the test box.
Assemble the radio but use the service cabinet to hold the chassis box.
Connect the test box and turn the radio on.
Connect a frequency counter to the signal sampler, refer to transmitter test setup.
Key the transmitter.
Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.
Requirement:

$F = F_{nom} \pm 0.2$ ppm (30 Hz at 150 MHz).

Switch to channel 2 and verify the frequency. (Channel switching is not possible while transmitting).

ADJUSTMENT OF HELICAL ANTENNA AN4111

The AN4111 is adjusted by a ferrite slug which can be pulled up or pushed down inside the antenna radiator. The slug should be adjusted to a position where maximum power is being radiated.
Remove the antenna cap for access to the tuning wire (fish line).

Place the field strength indicator in opright position on a non-metallic surface of at least 50x50 cm.

Hold the radio in upright position and key the transmitter.

Adjust the distance between the radio and the signal strength indicator for a clear indication of signal pick-up.

Adjust by pulling the tuning slug up or down for maximum signal strength.
This adjustment is sensitive to proximity effects and the hand's position, and several positions should be tried for optimum result-check current drain which should not exceeding 1 A.
Lock the tuning wire with the conical insert and cut the wire.

Mount antenna cap.

Note:
If a signal strength indicator D37 is not available a diode probe with a signal pickup wire and a multimeter or a deviation meter with a signal strength meter can be used to measure the radiated power.

CHAPTER 2a

CQP4110

2/10 CHANNELS VERSION

- ADJUSTMENT PROCEDURE
- TEST POINTS AND ADJUSTABLE COMPONENTS

ADJUSTMENT PROCEDURE

CQP4110

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4112: 146-174 MHz - 25 kHz channel spacing
CQP4113: 146-174 MHz - 20 kHz channel spacing
CQP4114: 146-174 MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4110:

RF Signal Generator	146-174 MHz
AF Voltmeter	Z_i >0.5 Mohm
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	Z_{out} ≥600 ohm
Frequency counter	5-200 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1
Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

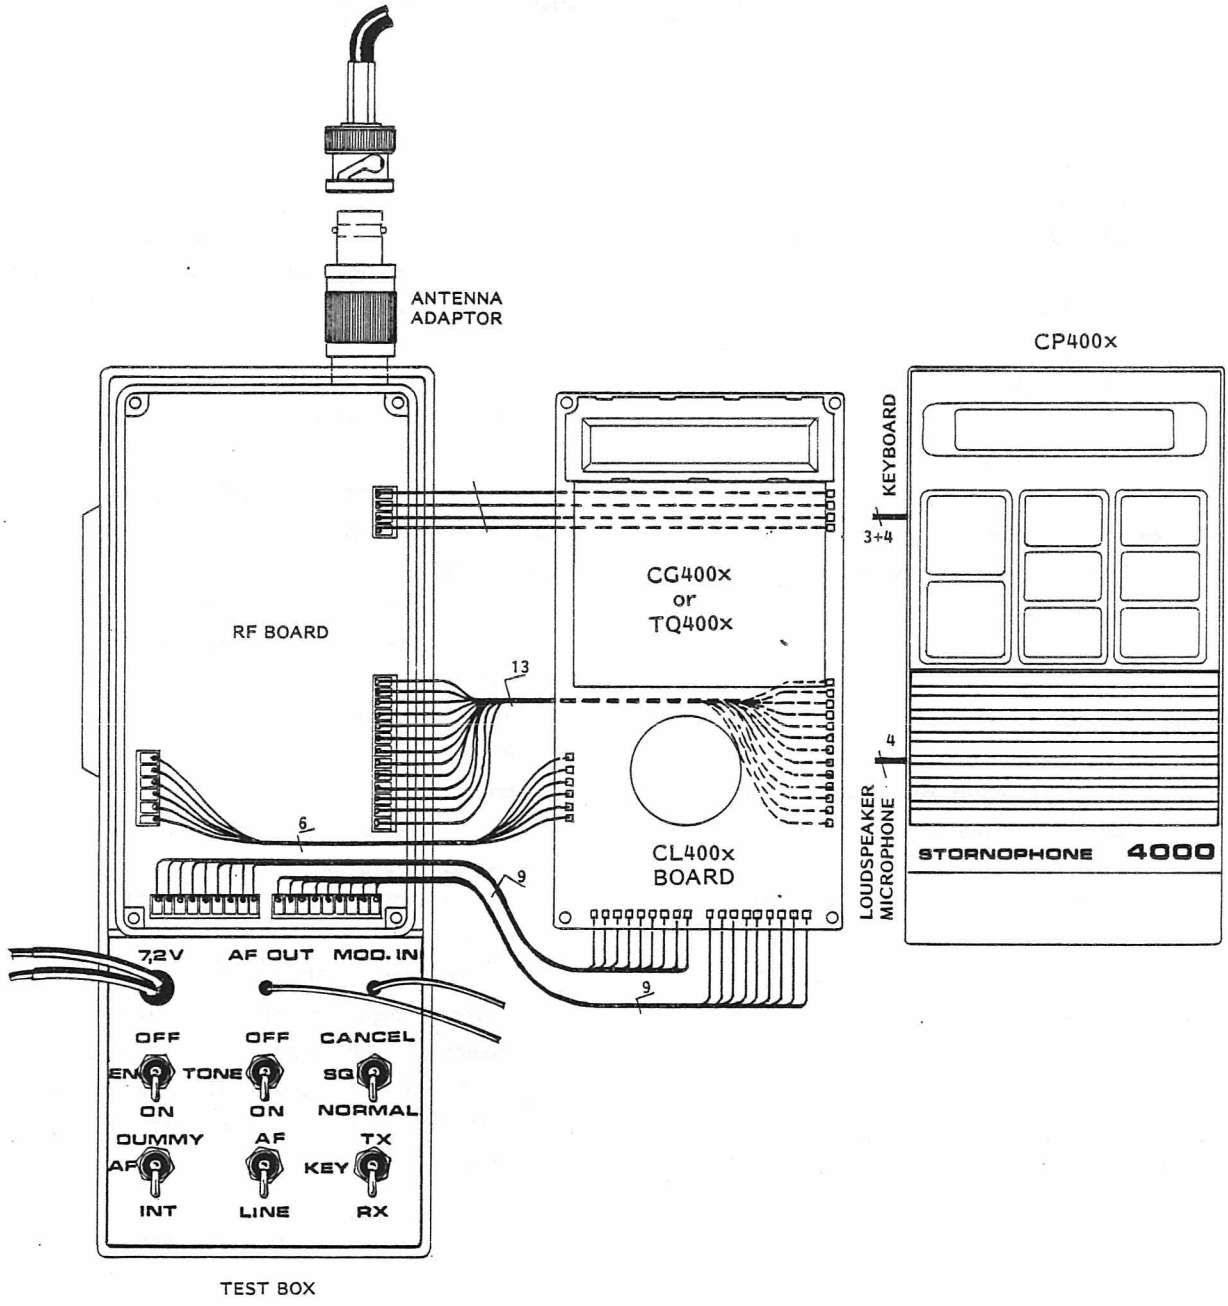
Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
- Take the CL400x board and the RF4110 board apart.
- Connect the CL400x board to the RF4110 board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.
Set the power supply voltage to 7.2 V.
Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.
Connect the voltmeter to the +5.5 V test point.
Read the 5.5 V regulated voltage.



TEST SETUP
STORNOPHONE 4000

D403.279/3

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13-CLOCK.
Read the reference frequency.
Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).
Adjust C533 for f_{nom} ±10 Hz.

Note:
The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.
Key the transmitter and read the current drain.
Requirement: less than 1 A.
Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Adjust C504 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.

Adjust C504 for a reading of 3 Volts. Adjust C504 so that the reading for each channel is inside the tuning range, 1 - 4 V. The channel with the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Connect the wattmeter to the antenna connector.
Adjust ADC potentiometer R115 for rated output power according to the type designation.
Note:
The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.
Connect the frequency counter to the signal sampler.
Key the transmitter and read the frequency.
Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).
Requirement: F_{nom} ±0.2 ppm (30 Hz at 150 MHz)
Deenergize the transmitter.
Select next channel
Key the transmitter and check for correct output frequency for each channel.

NOTE:
Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Connect the deviation meter to the signal sampler.
Connect the AF generator to MOD IN on the test box.
Set the AF generator frequency to 1000 Hz and the output as follows:
1100 mV with test box (11:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

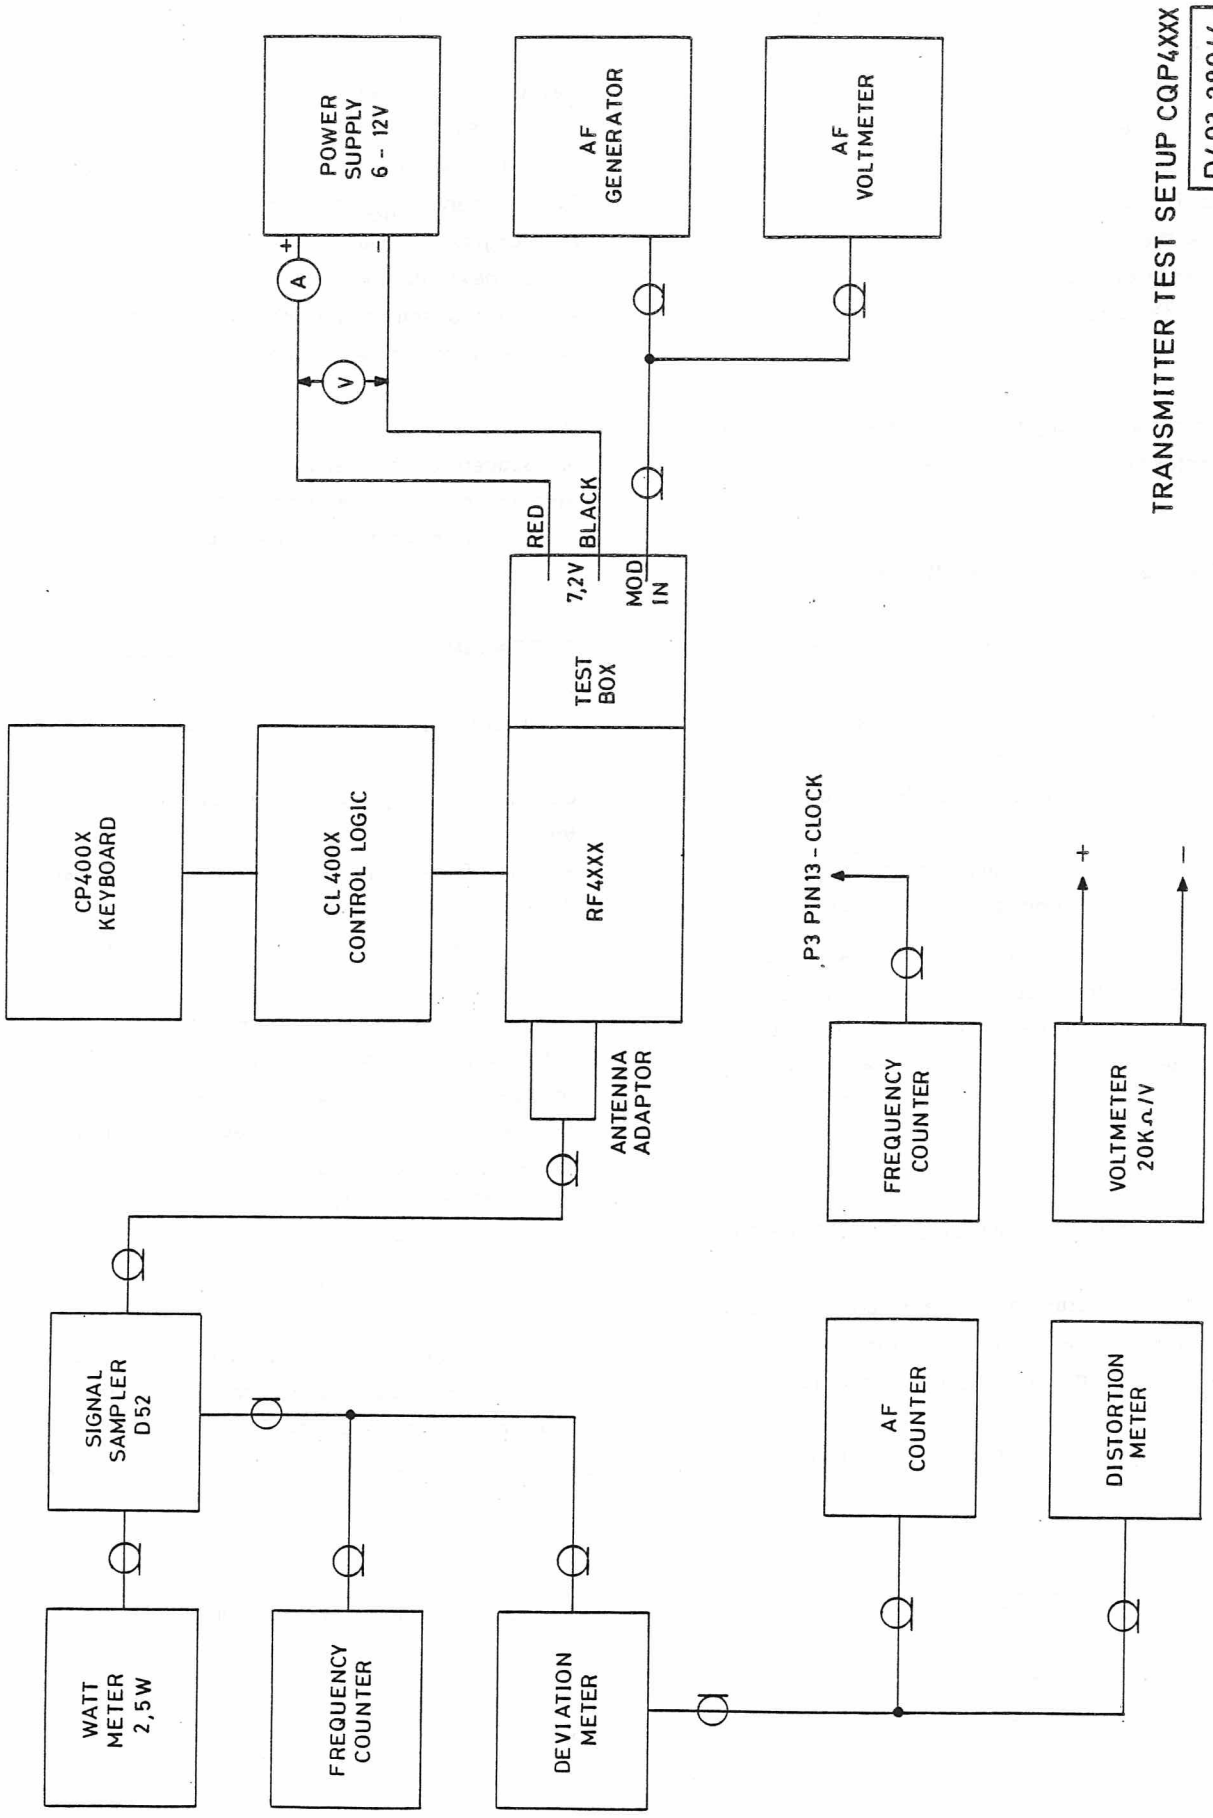
CQP4112: ±5 kHz
CQP4113: ±4 kHz
CQP4114: ±2.5 kHz

Set the AF generator frequency to 1000 Hz.
Reduce the AF generator output until a deviation of 0.7 x maximum deviation is obtained:

CQP4112: ±3.5 kHz
CQP4113: ±2.8 kHz
CQP4114: ±1.75 kHz

Typical generator output is 100 mV.

TRANSMITTER TEST SETUP CQP4XXX D403.280/4



RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Preset coil L508 as follows:
High end of band: 2/3 out of coil.
Low end of band: Fully down in coil form.
Set SQ switch to cancel.
Adjust C514 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.
Adjust C514 for a reading of 3 Volts. Adjust C514 so that the reading for each channel is inside the tuning range, 1 - 4 V.
The channel with the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.
Adjust L508 for maximum voltmeter reading, 0.2 V ±0.1 V. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel frequency.

Modulate the signal generator with 1000 Hz to 0.7 x maximum system deviation.
CQP4112: ±3.5 kHz
CQP4113: ±2.8 kHz
CQP4114: ±1.75 kHz

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.
Reduce the signal generator output until voltage reading is less than 1 V.

Adjust L402 and L308 for maximum voltmeter reading.
Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.
Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE
Connect the distortion meter to AF OUT.
Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14.
Set signal generator as described in paragraph 3.
Adjust R409 for a voltmeter reading of 110 mV ±5 mV.

5. FRONT-END ADJUSTMENT

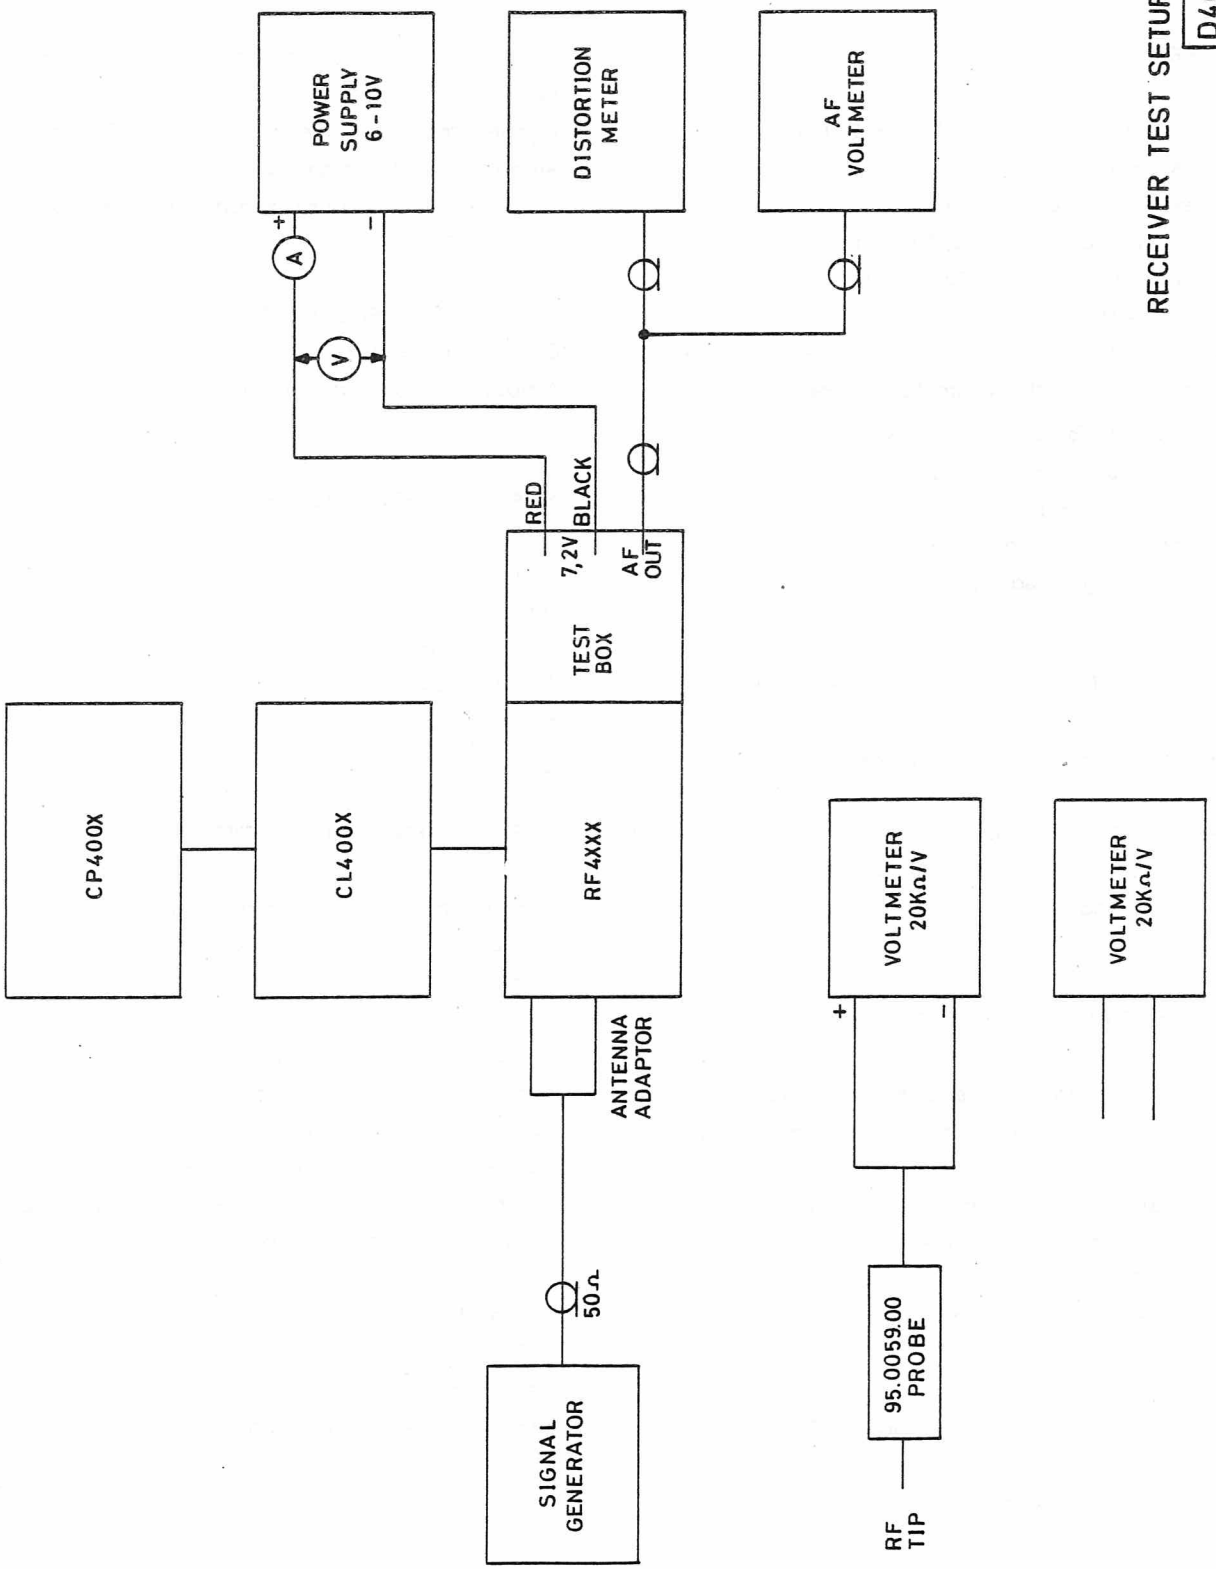
Connect the signal generator to the antenna connector and set its frequency to the channel frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.
Connect a distortion meter to AF OUT.
Set the LS-LINE switch on the test box to LINE.
Set the SQ switch to cancel.

Adjust the following coils for minimum distortion.
L306, L305, L303, L302 and L508.
As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.

RECEIVER TEST SETUP CQP4XXX D403.281/4



Check the 12 dB SINAD on all channels.

Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.
Open squelch by setting SQ switch to cancel.

Set the signal generator output to the value giving 12 dB SINAD.
Close squelch by setting SQ switch to normal.
Slowly turn R420 clockwise to the point where the squelch just opens.
Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD
Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.
Turn the radio off and remove the test box.
Assemble the radio but use the service cabinet to hold the chassis box.
Connect the test box and turn the radio on.
Connect a frequency counter to the signal sampler, refer to transmitter test setup.

Key the transmitter.
Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.
Requirement:

$F = F_{nom} \pm 0.2$ ppm (30 Hz at 150 MHz).

Switch to next channel. Verify the frequency for all channels. (Channel switching is not possible while transmitting).

CHAPTER 2b

CQP4110

AUTOMATIC VERSION

- ADJUSTMENT PROCEDURE
- TEST POINTS AND ADJUSTABLE COMPONENTS

STORNOPHONE 4000 AUTOMATIC

ADJUSTMENT PROCEDURE

RF BOARD ADJUSTMENTS

For adjustment of the RF board refer to the appropriate description:

RF411x - 60.617-E3
RF433x - 60.778-E2
RF466x - 60.779-E2

TEST SETUP

When the radio has been dismantled it should be fixed in service equipment SE4005 with the Control Panel CP4002 connected, or assembled in the test cabinet with extension cables and the test adapter SE4002. Note that the operation of the radio is totally different in the service mode.

SERVICE MODE SOFTWARE

The Stornophone 4000 Automatic software has an inherent test program which can be invoked when the radio is set up for test and alignment. In service mode the radio can be operated on 3 channels:
Channel 1: A lower pair of the user frequencies (RX/TX)
Channel 2: A pair of calculated center frequencies
Channel 3: The higher pair of the user frequencies

Channel 2 may necessarily not be a user channel but is included for alignment purposes as to optimize performance.

To invoke the service mode set the SE4002/SE4005 toggle switches as follows:

SWITCH	POSITION
EN	OFF
TONE	OFF
SQ	NORMAL
AF	INT
AF-LINE	LINE
KEY	RX

When the radio is turned on it will be in SERVICE MODE.

IMPORTANT
Don't change the setting of the EN and TONE switches while the radio is in service mode as this will result in an undefined condition of program execution. If this is done accidentally it will not harm the radio set but the operation will be in an uncontrolable state. The only way to clear the situation is to remove the DC power to the radio.

SERVICE MODE OPERATION

The service mode has two operating levels, 1 and 2.

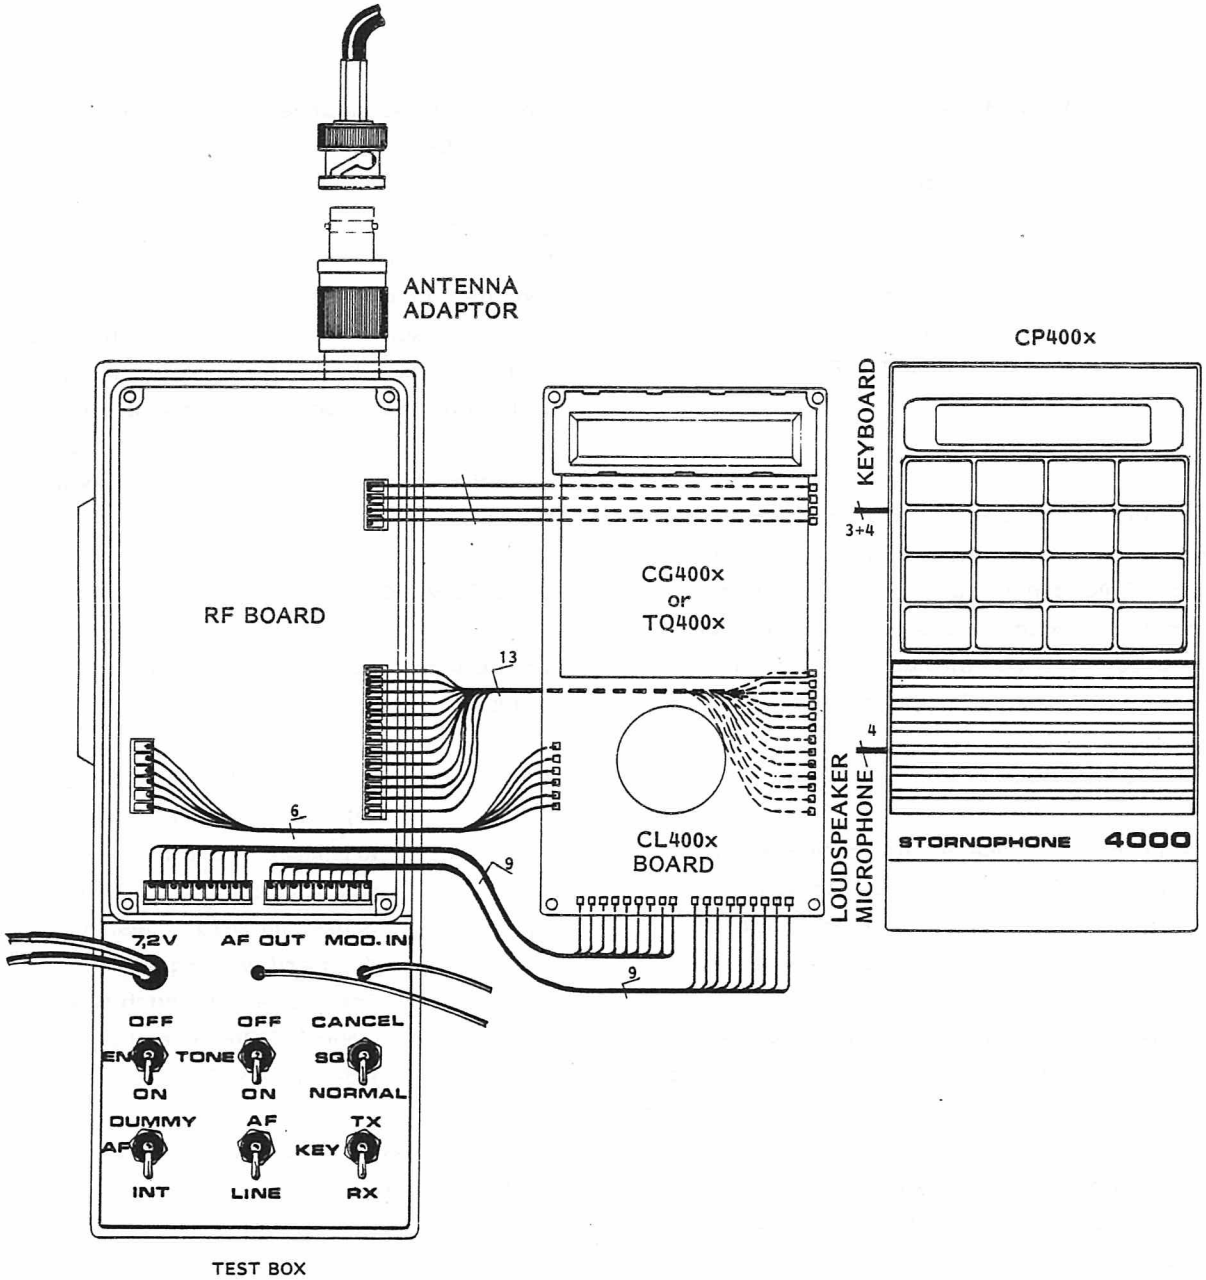
Level 1 is used for RF test (channel select), setting the volume and selecting the tone mode. Level 2 is entered by pressing the ON/OFF button.

Level 2 is used for display test (LCD), Keyboard test, Squelch ON/OFF, Encode/Decode switch of subunit 0 and 1 (TQ4009) and continuous side tone ON/OFF.

The Service Mode Keyboard configurations appear from fig. 1, 2 and 3.

TONE SUBUNIT TEST (TQ4009)

The Tone Subunits 0 and 1 (TQ4009) can be tested for DECODE and ENCODE. In ENCODE-phase a capital letter "E" is indicated in the display for the pertinent tone subunit.
When a correct tone is decoded (detected) a "small" letter "d" is indicated in the display.



TEST SET-UP
STORNOPHONE 4000 AUTOMATIC

D404.094

Please note: This tone subunit test is a single tone test, not sequential. In ENCODE-mode the transmitter is permanently and automatically keyed with a single continuous AF-signal.

In ENCODE-mode it is further possible to transmit a true (continuous) DTMF (Touch-tone or Double-tone signal). It is not possible in DECODE-mode to decode (detect) a DTMF-signal.

The Tone Loading-Codes are listed below.

TONE LOADING CODES

Display-code	CCIR no.	Frequency (norm.)
00	0	1981 Hz
01	1	1124 Hz
02	2	1197 Hz
03	3	1275 Hz
04	4	1358 Hz
05	5	1446 Hz
06	6	1540 Hz
07	7	1640 Hz
08	8	1747 Hz
09	9	1860 Hz
10	G	2400 Hz
11		930 Hz
12		2247 Hz
13		991 Hz
14	R (Repeat)	2110 Hz

Display code	CCITT DTMF (norm.)
15	697 Hz
16	770 Hz
17	852 Hz
18	941 Hz
19	1209 Hz
20	1336 Hz
21	1475 Hz
22	1633 Hz

Display codes

> 22	Will be ignored

TONE MODULATION ADJUSTMENT

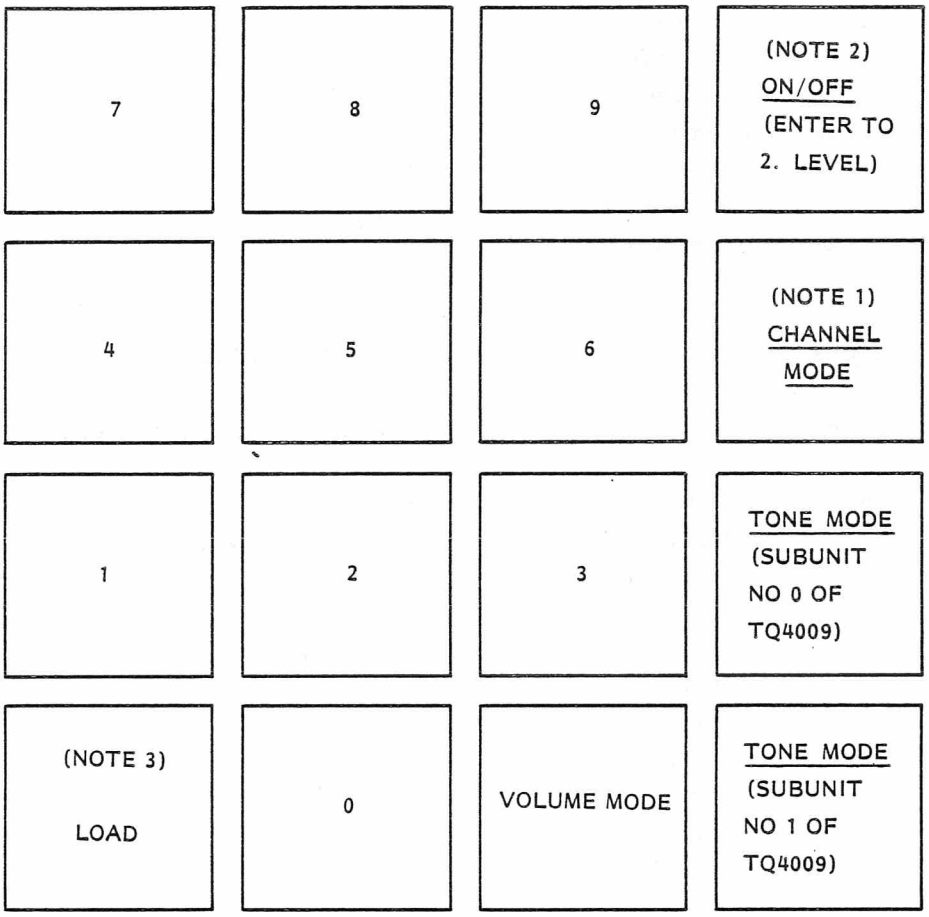
Connect a frequency deviationmeter to the antenna connector.
Enter service mode level 2 and turn the side tone on. The transmitter will automatically be keyed.

Adjust R824 for 3.5 kHz deviation.

KEYBOARD CONFIGURATION

FIG. 1

SERVICE MODE 1. LEVEL



NOTE 1: In service mode only 3 RF channels can be accessed,
CH1 = lowest user RF frequency (RX and TX)
CH2 = center RF frequency (RX and TX)
CH3 = highest RF user RF frequency (RX and TX)

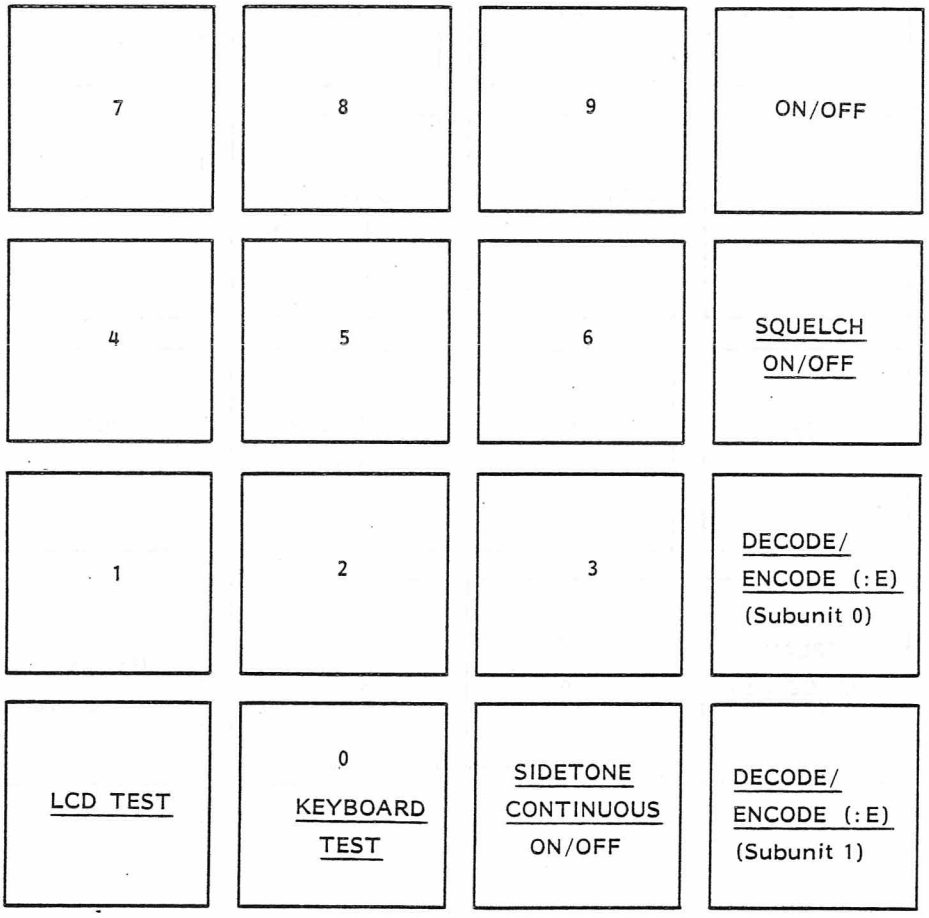
NOTE 2: After pressing this button once the set will be in the 2nd service mode for approx. 5 seconds.

NOTE 3: Load, i.e.: enter channel number or AF-tone.

KEYBOARD CONFIGURATION

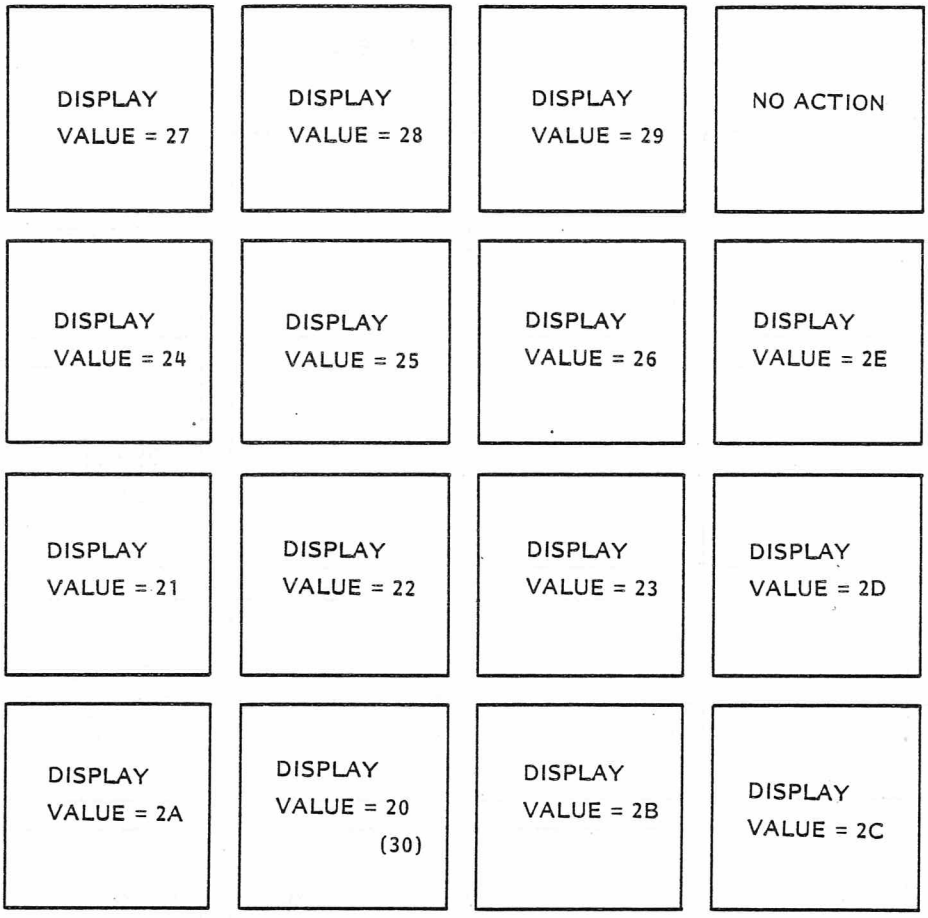
SERVICE MODE 2. LEVEL

FIG. 2



KEYBOARD TEST

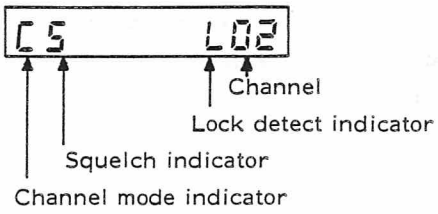
FIG. 3



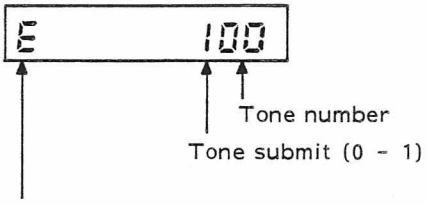
NOTE: The first digit indicates the test level
The second digit indicates the HEX value
of the pertinent keyboard field.

SERVICE MODE DISPLAY

Channel mode



Tone mode



E = Encode
d = Decode

AF VOLUME TEST

The AF volume level can be changed and checked by entering the volume mode.
From service level 1 press the volume mode button and the present volume level is displayed in the three rightmost places.
Press buttons 0 - 7 to change the volume setting.
Press a new function button to exit.

LOCK DETECT INDICATOR

In channel mode the status of the synthesizer lock detect circuit is being echoed in the display. When the circuit is locked an "L" is displayed to the left of the channel number both in receive and transmit condition.

SQUELCH DETECT INDICATOR

The status of the squelch circuit is echoed in the display. When the squelch circuit is being activated by a carrier or by pressing squelch cancel an "S" is displayed to the right of the C (Channel mode). To cancel the squelch press the ON/OFF button once, enter level 2 and within 5 sec. press the channel mode button (squelch). Using the same procedure once more will reactivate the squelch circuit.

DISPLAY TEST

The display can be tested from the keyboard to ensure that all display segments except the bell symbol are operating properly.

To enter the display test press the ON/OFF button once (level 2) and within 5 sec. press the LCD test button. All display segments except the bell will then be turned on. Press ON/OFF and a new function button to exist.

KEYBOARD TEST

Each button on the keyboard can be tested for proper operation when the keyboard test is enabled. To enter the keyboard test press the ON/OFF button once (level 2) and within 5 sec. press the keyboard test button and the display will read "30". When pressing a key the internal value of the key will be echoed in the display. Note that the buttons 1 - 9 have not been defined and pressing any of these buttons causes no change in the display. Press ON/OFF and a function button to exit.

ALERT TONE TEST

The alert tone can be turned on and sounded continuously. Press the ON/OFF button (level 2) and within 5 sec. the alert tone button (side tone).

The alert tone will be turned on and its volume will be at level 4 independently of the volume setting. Press ON/OFF and the alert tone button again to exit

BATTERY VOLUME THRESHOLD

The battery low voltage threshold at which the radio automatically turns off can be checked by lowering the voltage from the external powersupply until the bell indicater turns on and a 1 sec. alert tone is sounded. The power supply voltage at this point is the threshold voltage. Increasing the voltage above the threshold voltage will turn the bell indicator off and sound a 1 sec. alert tone. If the alert tone is sounded continously the power supply voltage is exactly equal to the threshold voltage.

CHAPTER 3.

CQP4330

ADJUSTMENT PROCEDURE

TEST POINTS AND ADJUSTABLE COMPONENTS

RF BOARD RF4330

ADJUSTMENT PROCEDURE

CQP4330

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4332: 66-88 MHz - 25 kHz channel spacing
CQP4333: 66-88 MHz - 20 kHz channel spacing
CQP4334: 66-88 MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4330:

RF Signal Generator	66-88 MHz
AF Voltmeter	Z_i >0.5 Mohm
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	Z_{out} ≥600 ohm
Frequency counter	5-200 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1
Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

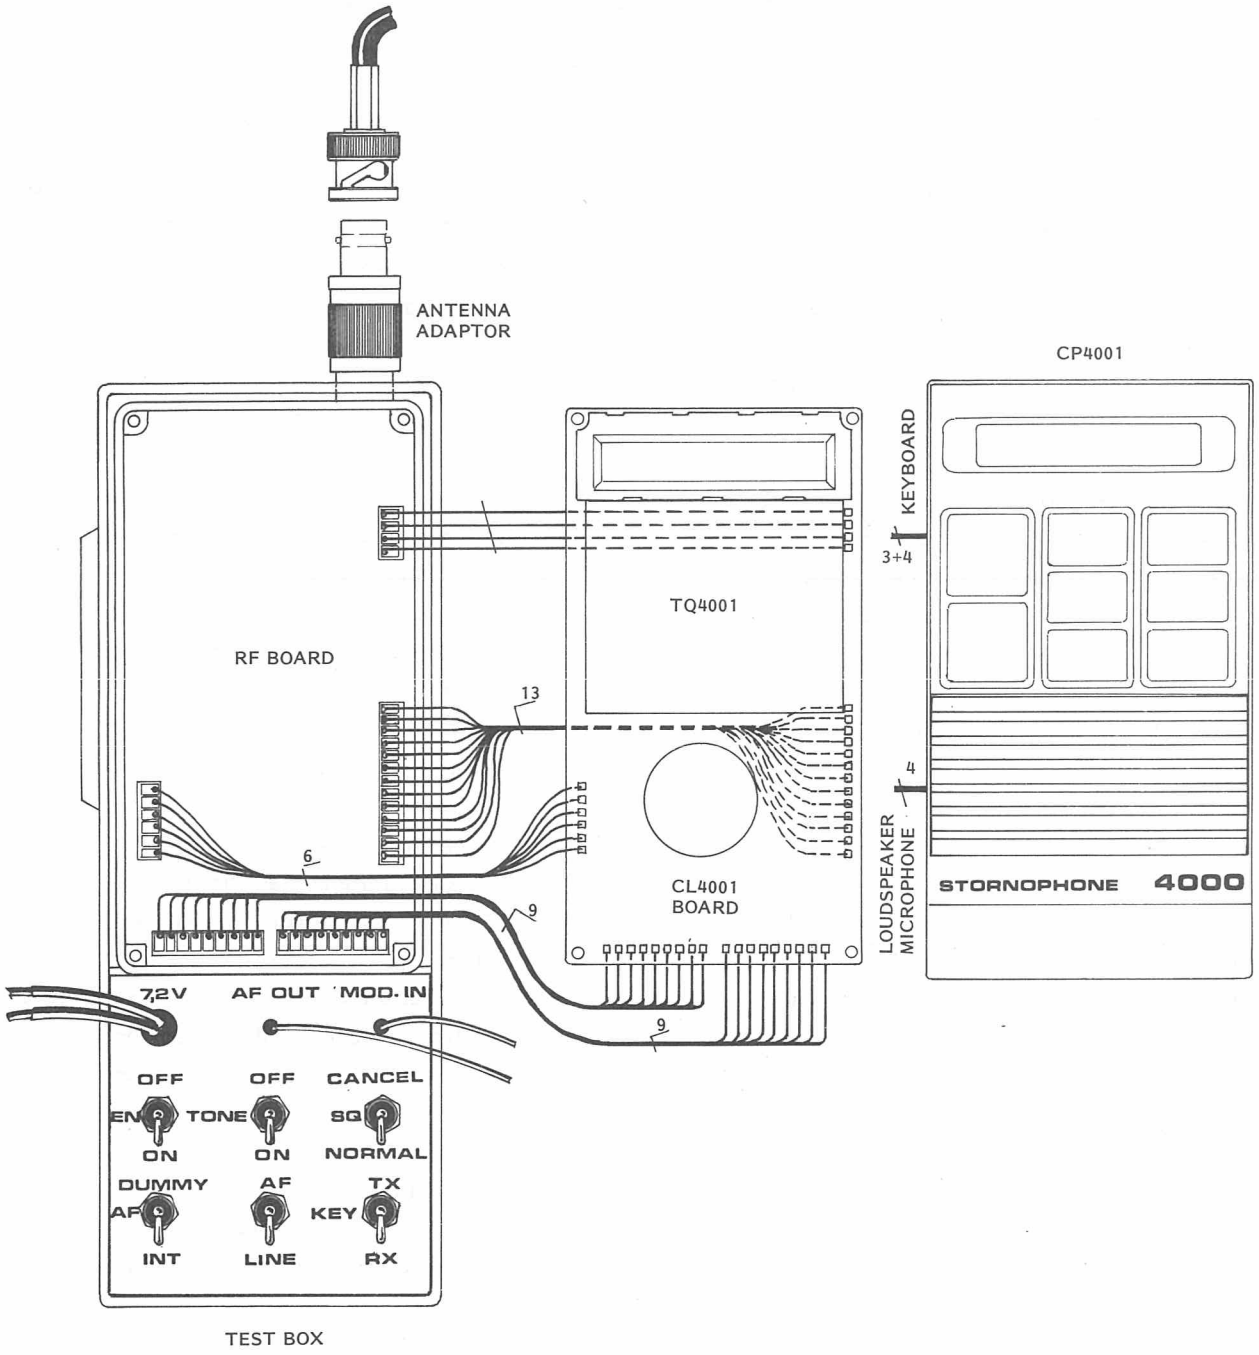
Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
- Take the CL4001 board and the RF4110 board apart.
- Connect the CL4001 board to the RF4110 board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.
Set the power supply voltage to 7.2 V.
Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.
Connect the voltmeter to the +5.5 V test point.
Read the 5.5 V regulated voltage.



TEST SETUP
STORNOPHONE 4000

D403.279

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13-CLOCK.
Read the reference frequency.
Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).
Adjust C533 for f_{nom} ±10 Hz.

Note:
The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.
Key the transmitter and read the current drain.
Requirement: less than 1 A.
Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Adjust L502 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.

Adjust L502 for a reading of 3 Volts. For radios with 2 channels adjust L502 so that the reading for each channel is inside the tuning range, 1-5 V. The channel with the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Connect the wattmeter to the antenna connector.
Adjust ADC potentiometer R115 for rated output power according to the type designation.
Note:
The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.
Connect the frequency counter to the signal sampler.
Key the transmitter and read the frequency.
Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).
Requirement: F_{nom} ±0.2 ppm (40 Hz at 80 MHz)
Deenergize the transmitter.
Select channel 2, if used.
Key the transmitter and check for correct output frequency.

NOTE:
Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Connect the deviation meter to the signal sampler.
Connect the AF generator to MOD IN on the test box.
Set the AF generator frequency to 1000 Hz and the output as follows:
1100 mV with test box (10:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

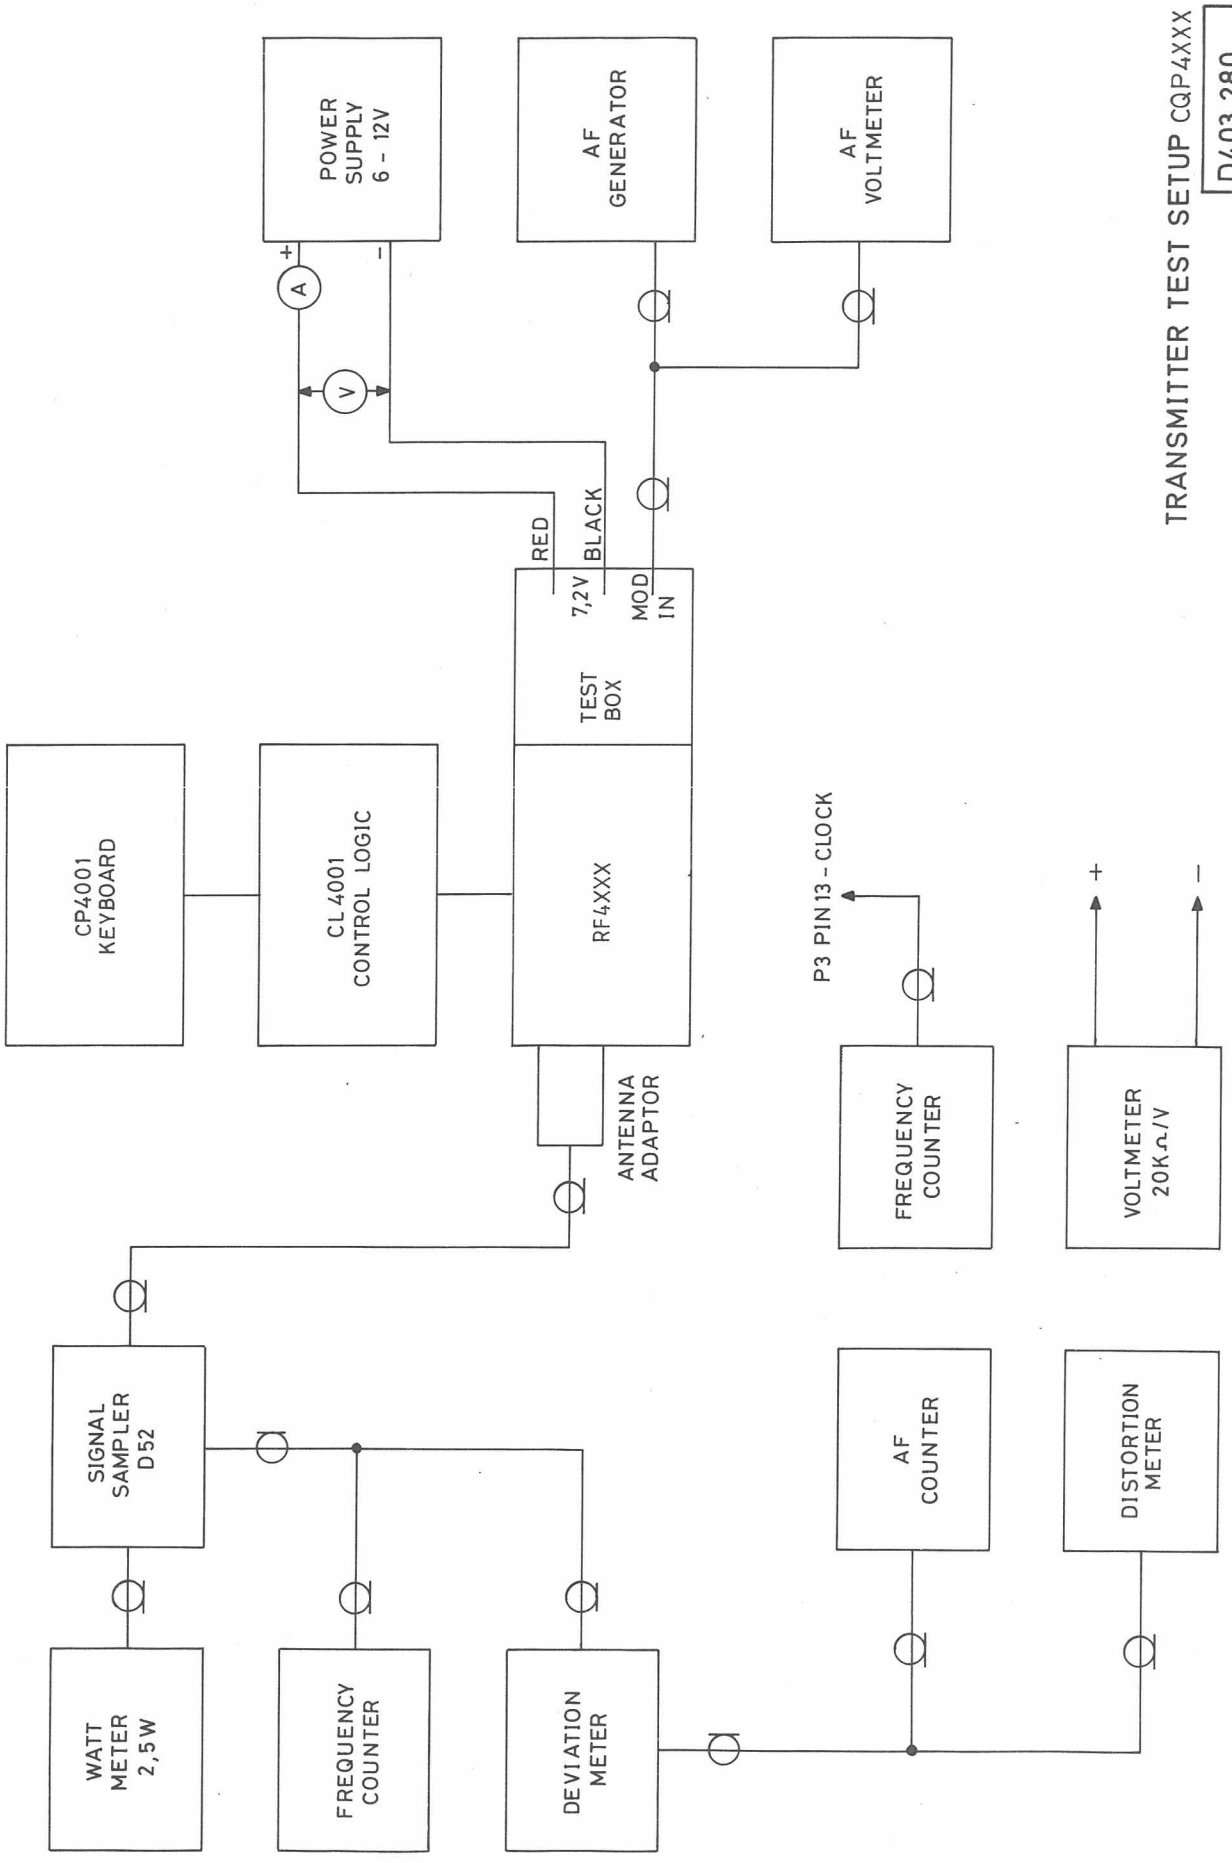
CQP4332: ±5 kHz
CQP4333: ±4 kHz
CQP4334: ±2.5 kHz

Set the AF generator frequency to 1000 Hz.
Reduce the AF generator output until a deviation of 0.7 x maximum deviation is obtained:

CQP4332: ±3.5 kHz
CQP4333: ±2.8 kHz
CQP4334: ±1.75 kHz

Typical generator output is 100 mV.

TRANSMITTER TEST SETUP CQP4XXX D403.280



RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Preset coil L508 as follows:

High end of band: 2/3 out of coil.
Low end of band: Fully down in coil form.

Set SQ switch to cancel.
Adjust L507 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.
Adjust L507 for a reading of 3 Volts. For radios with 2 channels adjust L507 so that the reading for each channel is inside the tuning range, 1-5 V. The channel with the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.
Adjust L508 for maximum voltmeter reading, 0.2 V ±0.1 V. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel frequency.

Modulate the signal generator with 1000 Hz to 0.7 x maximum system deviation.

CQP4332: ±3.5 kHz
CQP4333: ±2.8 kHz
CQP4334: ±1.75 kHz

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.
Reduce the signal generator output until voltage reading is less than 1 V.
Adjust L402 and L308 for maximum voltmeter reading.
Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.
Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE
Connect the distortion meter to AF OUT.
Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14.
Set signal generator as described in paragraph 3.
Adjust R409 for a voltmeter reading of 110 mV ±5 mV.

5. FRONT-END ADJUSTMENT

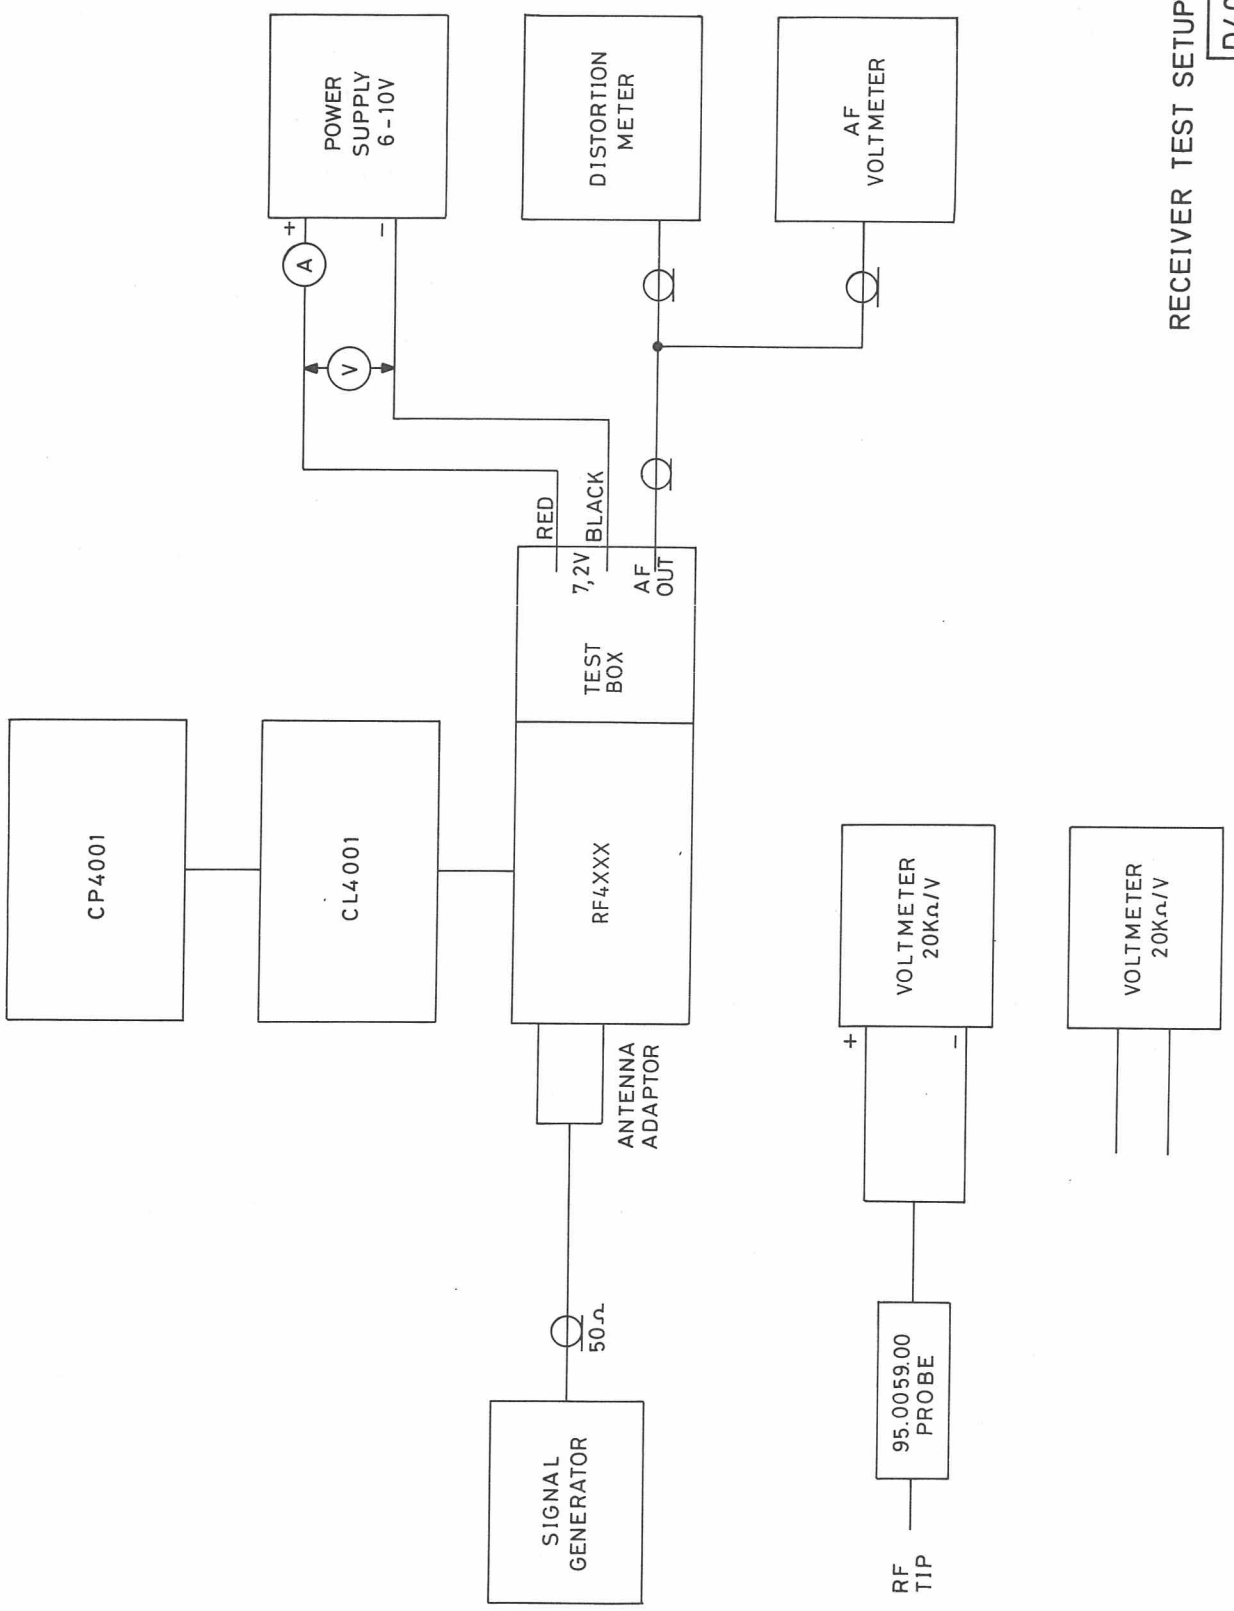
Connect the signal generator to the antenna connector and set its frequency to the channel frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.
Connect a distortion meter to AF OUT.
Set the LS-LINE switch on the test box to LINE.
Set the SQ switch to cancel.

Adjust the following coils for minimum distortion. L306, L305, L303, L302 and L508.
As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.

RECEIVER TEST SETUP CQP4XXX D403.281



Check the 12 dB SINAD on both channels, if used.
Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.
Open squelch by setting SQ switch to cancel.

Set the signal generator output to the value giving 12 dB SINAD.
Close squelch by setting SQ switch to normal.
Slowly turn R420 clockwise to the point where the squelch just opens.
Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD
Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.
Turn the radio off and remove the test box.
Assemble the radio but use the service cabinet to hold the chassis box.
Connect the test box and turn the radio on.
Connect a frequency counter to the signal sampler, refer to transmitter test setup.
Key the transmitter.
Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.
Requirement:

$F = F_{nom} \pm 0.2$ ppm (40 Hz at 80 MHz)

Switch to channel 2 and verify the frequency. (Channel switching is not possible while transmitting).

ADJUSTMENT OF HELICAL ANTENNA AN4xx1

The AN4xx1 is adjusted by a ferrite slug which can be pulled up or pushed down inside the antenna radiator. The slug should be adjusted to a position where maximum power is being radiated.
Remove the antenna cap for access to the tuning wire (fish line).

Place the field strength indicator in opright position on a non-metallic surface of at least 50x50 cm.

Hold the radio in upright position and key the transmitter.

Adjust the distance between the radio and the signal strength indicator for a clear indication of signal pick-up.

Adjust by pulling the tuning slug up or down for maximum signal strength.
This adjustment is sensitive to proximity effects and the hand's position, and several positions should be tried for optimum result-check current drain which should not exceeding 1 A.
Lock the tuning wire with the conical insert and cut the wire.

Mount antenna cap.

Note:
If a signal strength indicator D37 is not available a diode probe with a signal pickup wire and a multimeter or a deviation meter with a signal strength meter can be used to measure the radiated power.

2/10 CHANNELS VERSION

- ADJUSTMENT PROCEDURE
- TEST POINTS AND ADJUSTABLE COMPONENTS

ADJUSTMENT PROCEDURE

CQP4330

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4332: 66-88 MHz - 25 kHz channel spacing
CQP4333: 66-88 MHz - 20 kHz channel spacing
CQP4334: 66-88 MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4330:

RF Signal Generator	66-88 MHz
AF Voltmeter	Z_i >0.5 Mohm
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	Z_{out} ≥600 ohm
Frequency counter	5-200 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1
Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

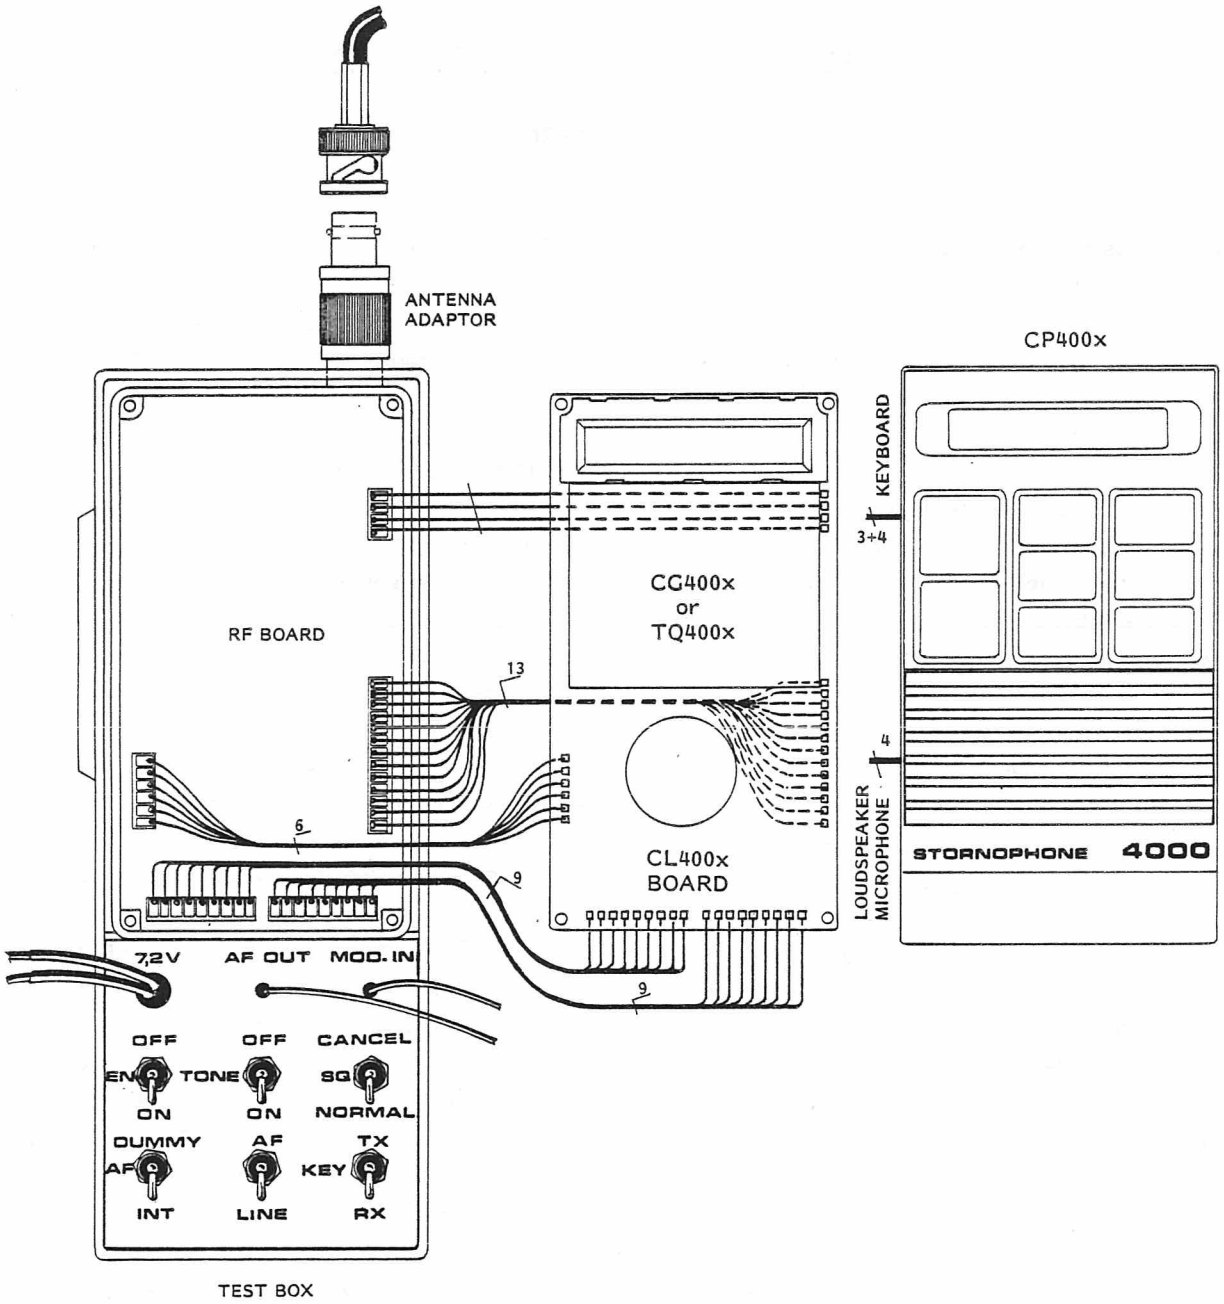
Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
- Take the CL400x board and the RF4330 board apart.
- Connect the CL400x board to the RF4330 board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.
Set the power supply voltage to 7.2 V.
Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.
Connect the voltmeter to the +5.5 V test point.
Read the 5.5 V regulated voltage.



TEST SETUP
STORNOPHONE 4000

D403.279/3

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13- CLOCK.
Read the reference frequency.
Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).
Adjust C533 for f_{nom} ±10 Hz.

Note:
The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.
Key the transmitter and read the current drain.
Requirement: less than 1 A.
Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Adjust L502 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.

Adjust L502 for a reading of 3 Volts. Adjust L502 so that the reading for each channel is inside the tuning range, 1 - 4 V.
The channel with the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Connect the wattmeter to the antenna connector.
Adjust ADC potentiometer R115 for rated output power according to the type designation.
Note:
The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.
Connect the frequency counter to the signal sampler.
Key the transmitter and read the frequency.
Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).
Requirement: F_{nom} ±0.2 ppm (40 Hz at 80 MHz)
Deenergize the transmitter.
Select next channel.
Key the transmitter and check for correct output frequency for each channel.

NOTE:
Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Connect the deviation meter to the signal sampler.
Connect the AF generator to MOD IN on the test box.
Set the AF generator frequency to 1000 Hz and the output as follows:
1100 mV with test box (11:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

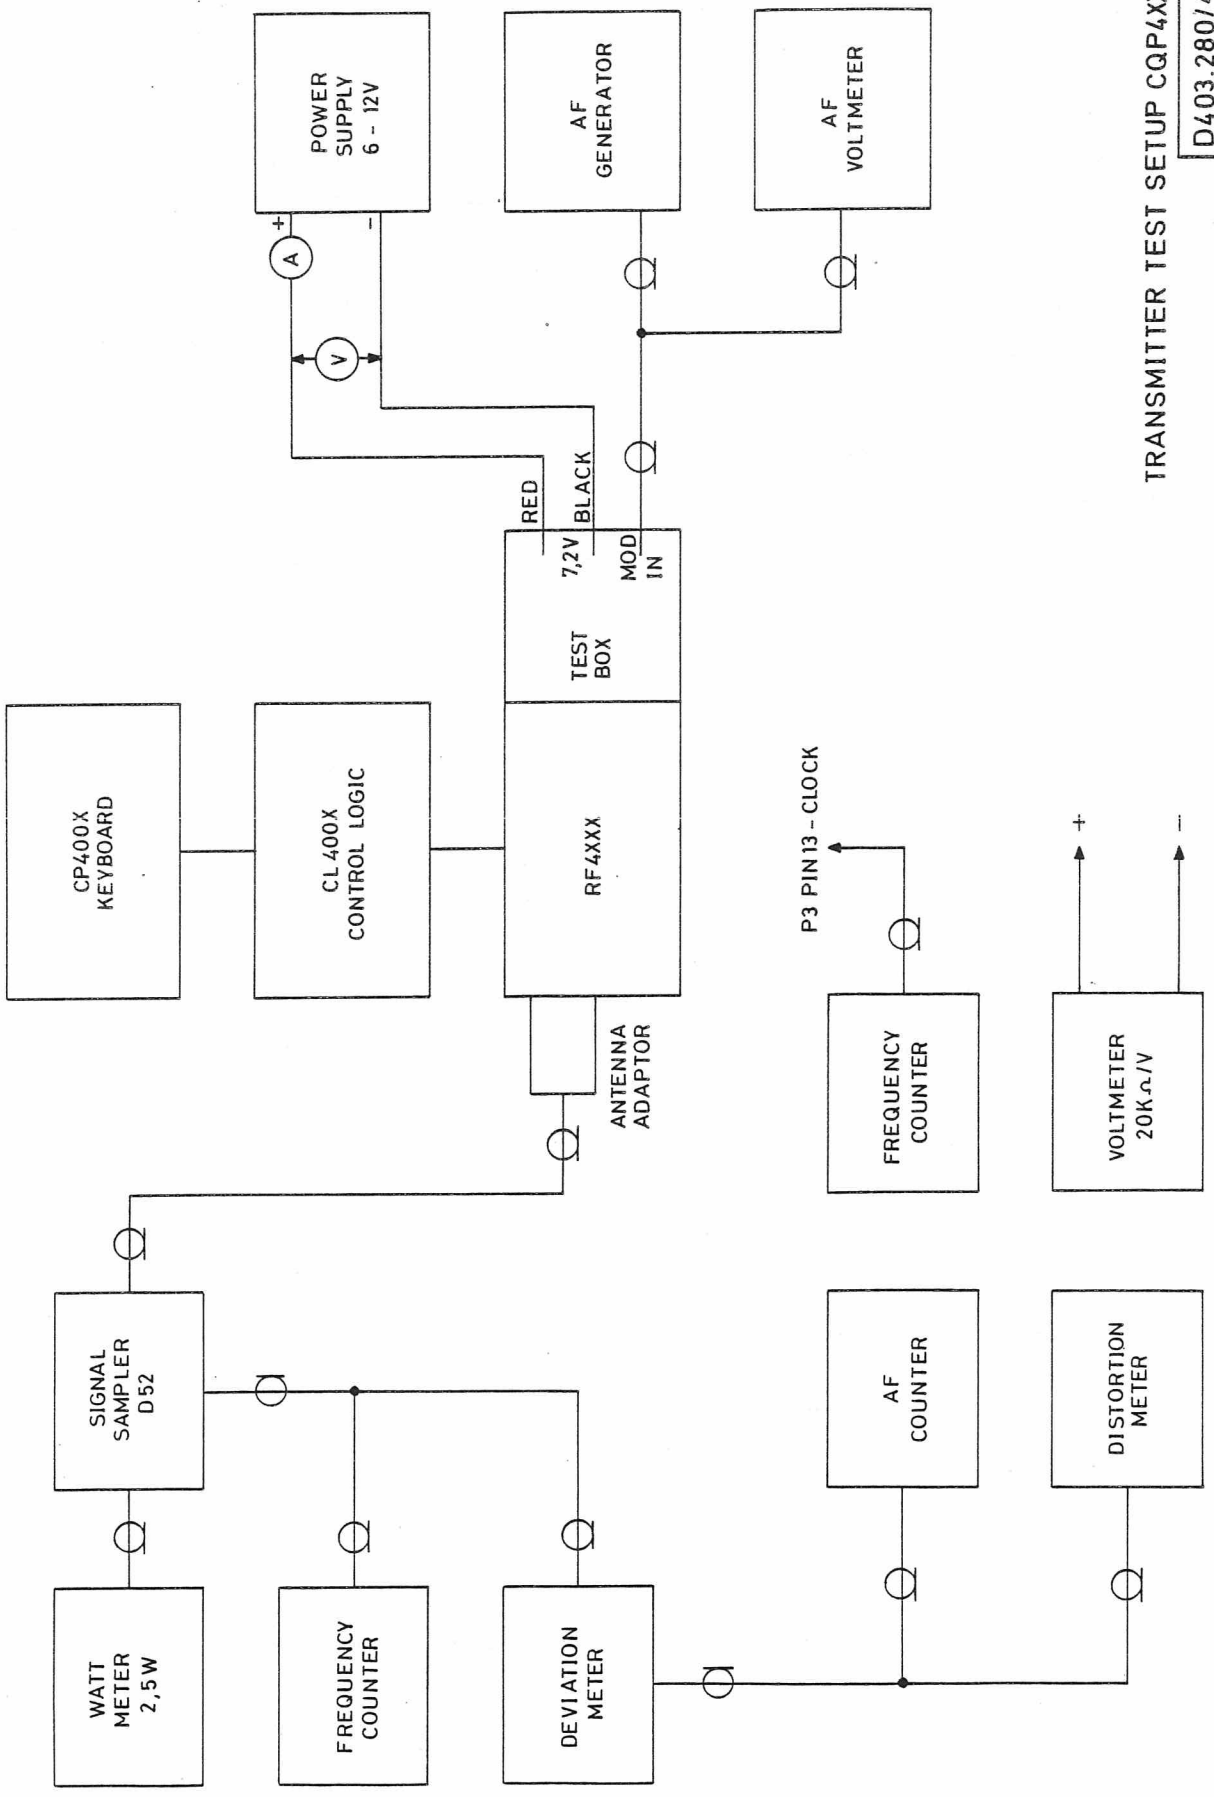
CQP4332: ±5 kHz
CQP4333: ±4 kHz
CQP4334: ±2.5 kHz

Set the AF generator frequency to 1000 Hz.
Reduce the AF generator output until a deviation of 0.7 x maximum deviation is obtained:

CQP4332: ±3.5 kHz
CQP4333: ±2.8 kHz
CQP4334: ±1.75 kHz

Typical generator output is 100 mV.

TRANSMITTER TEST SETUP CQP4XXX D403.280/4



RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Preset coil L508 as follows:
High end of band: 2/3 out of coil.
Low end of band: Fully down in coil form.
Set SQ switch to cancel.
Adjust L507 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.
Adjust L507 for a reading of 3 Volts. Adjust L507 so that the reading for each channel is inside the tuning range, 1 - 4 V.
The channel with the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.
Adjust L508 for maximum voltmeter reading, 0.2 V ±0.1 V. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel frequency.

Modulate the signal generator with 1000 Hz to 0.7 x maximum system deviation.
CQP4332: ±3.5 kHz
CQP4333: ±2.8 kHz
CQP4334: ±1.75 kHz

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.
Reduce the signal generator output until voltage reading is less than 1 V.
Adjust L402 and L308 for maximum voltmeter reading.
Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.
Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE
Connect the distortion meter to AF OUT.
Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14.
Set signal generator as described in paragraph 3.
Adjust R409 for a voltmeter reading of 110 mV ±5 mV.

5. FRONT-END ADJUSTMENT

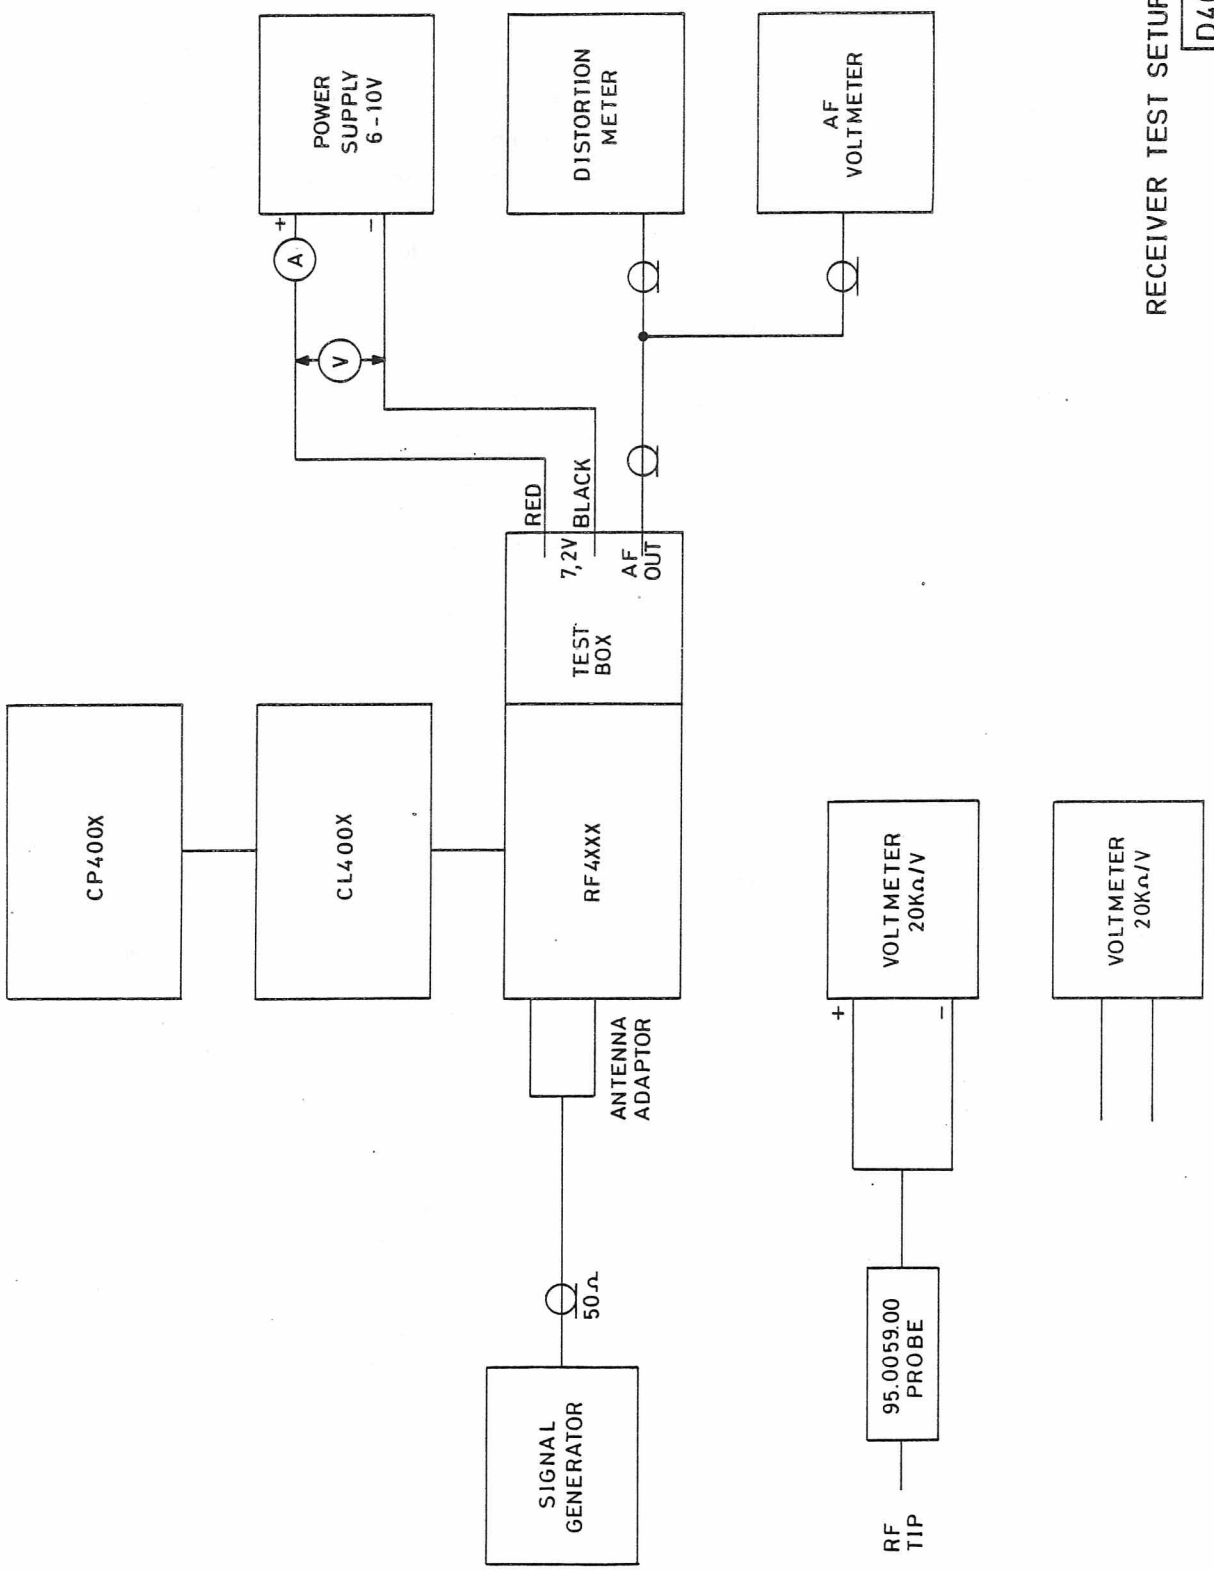
Connect the signal generator to the antenna connector and set its frequency to the channel frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.
Connect a distortion meter to AF OUT.
Set the LS-LINE switch on the test box to LINE.
Set the SQ switch to cancel.

Adjust the following coils for minimum distortion.
L306, L305, L303, L302, L508 and L308.
As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.

RECEIVER TEST SETUP CQP4XXX D403.281/4



Check the 12 dB SINAD on all channels.

Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.
Open squelch by setting SQ switch to cancel.

Set the signal generator output to the value giving 12 dB SINAD.
Close squelch by setting SQ switch to normal.
Slowly turn R420 clockwise to the point where the squelch just opens.
Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD
Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.
Turn the radio off and remove the test box.
Assemble the radio but use the service cabinet to hold the chassis box.
Connect the test box and turn the radio on.
Connect a frequency counter to the signal sampler, refer to transmitter test setup.

Key the transmitter.
Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.
Requirement:

$F = F_{nom} \pm 0.2$ ppm (40 Hz at 80 MHz)

Switch to next channel. Verify the frequency for all channels. (Channel switching is not possible while transmitting).

CHAPTER 4.

CQP4660

ADJUSTMENT PROCEDURE

TEST POINTS AND ADJUSTABLE COMPONENTS

RF BOARD RF4660

ADJUSTMENT PROCEDURE

CQP4660

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4662: 400-470MHz - 25 kHz channel spacing
CQP4663: 400-470MHz - 20 kHz channel spacing
CQP4664: 400-470MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4660:

RF Signal Generator	400-470 MHz
AF Voltmeter	Z_i >0.5 Mohm
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	Z_{out} ≥600 ohm
Frequency counter	5-200 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1
Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

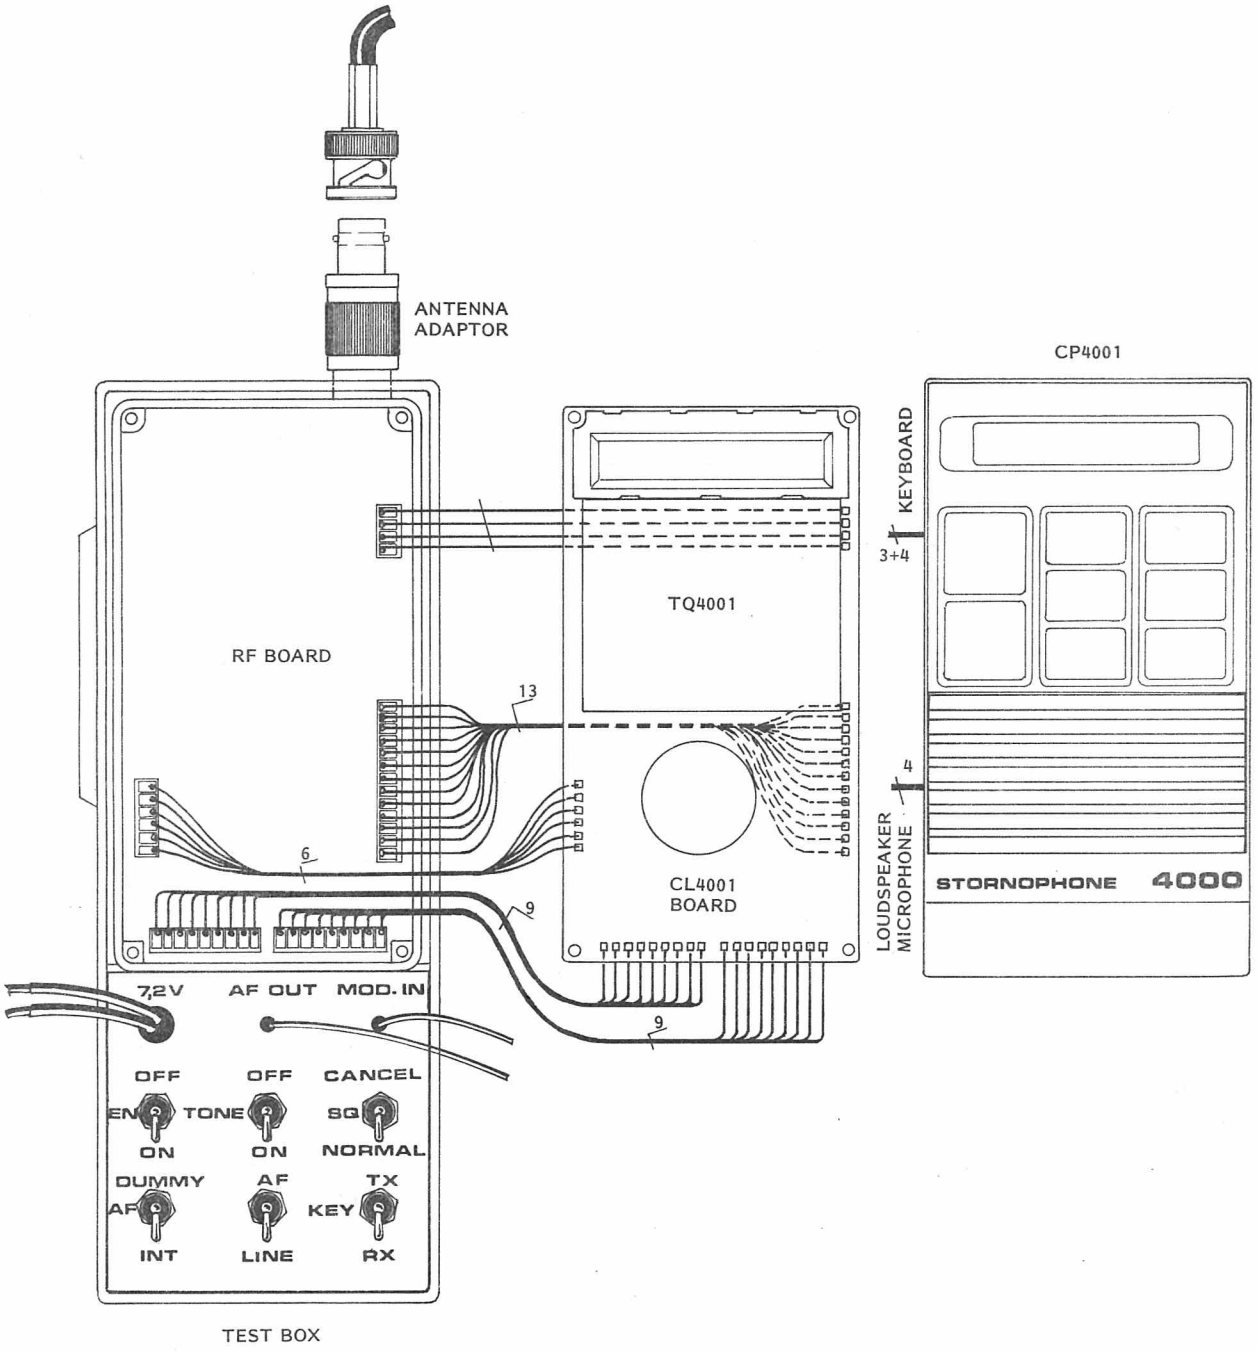
Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
- Take the CL4001 board and the RF4110 board apart.
- Connect the CL4001 board to the RF4110 board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.
Set the power supply voltage to 7.2 V.
Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.
Connect the voltmeter to the +5.5 V test point.
Read the 5.5 V regulated voltage.



TEST SETUP
STORNOPHONE 4000

D403.279

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13-CLOCK.
Read the reference frequency.
Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).
Adjust C533 for f_{nom} ±10 Hz.

Note:
The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.
Key the transmitter and read the current drain.
Requirement: less than 1 A.
Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Adjust C504 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.

Adjust C504 for a reading of 3 Volts. For radios with 2 channels adjust C504 so that the reading for each channel is inside the tuning range, 1-5 V. The channel with the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Connect the wattmeter to the antenna connector.
Adjust ADC potentiometer R115 for rated output power according to the type designation.
Note:
The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.
Connect the frequency counter to the signal sampler.
Key the transmitter and read the frequency.
Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).
Requirement: F_{nom} ±0.2 ppm (225 Hz at 450 MHz)
Deenergize the transmitter.
Select channel 2, if used.
Key the transmitter and check for correct output frequency.

NOTE:
Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Connect the deviation meter to the signal sampler.
Connect the AF generator to MOD IN on the test box.
Set the AF generator frequency to 1000 Hz and the output as follows:
1100 mV with test box (10:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

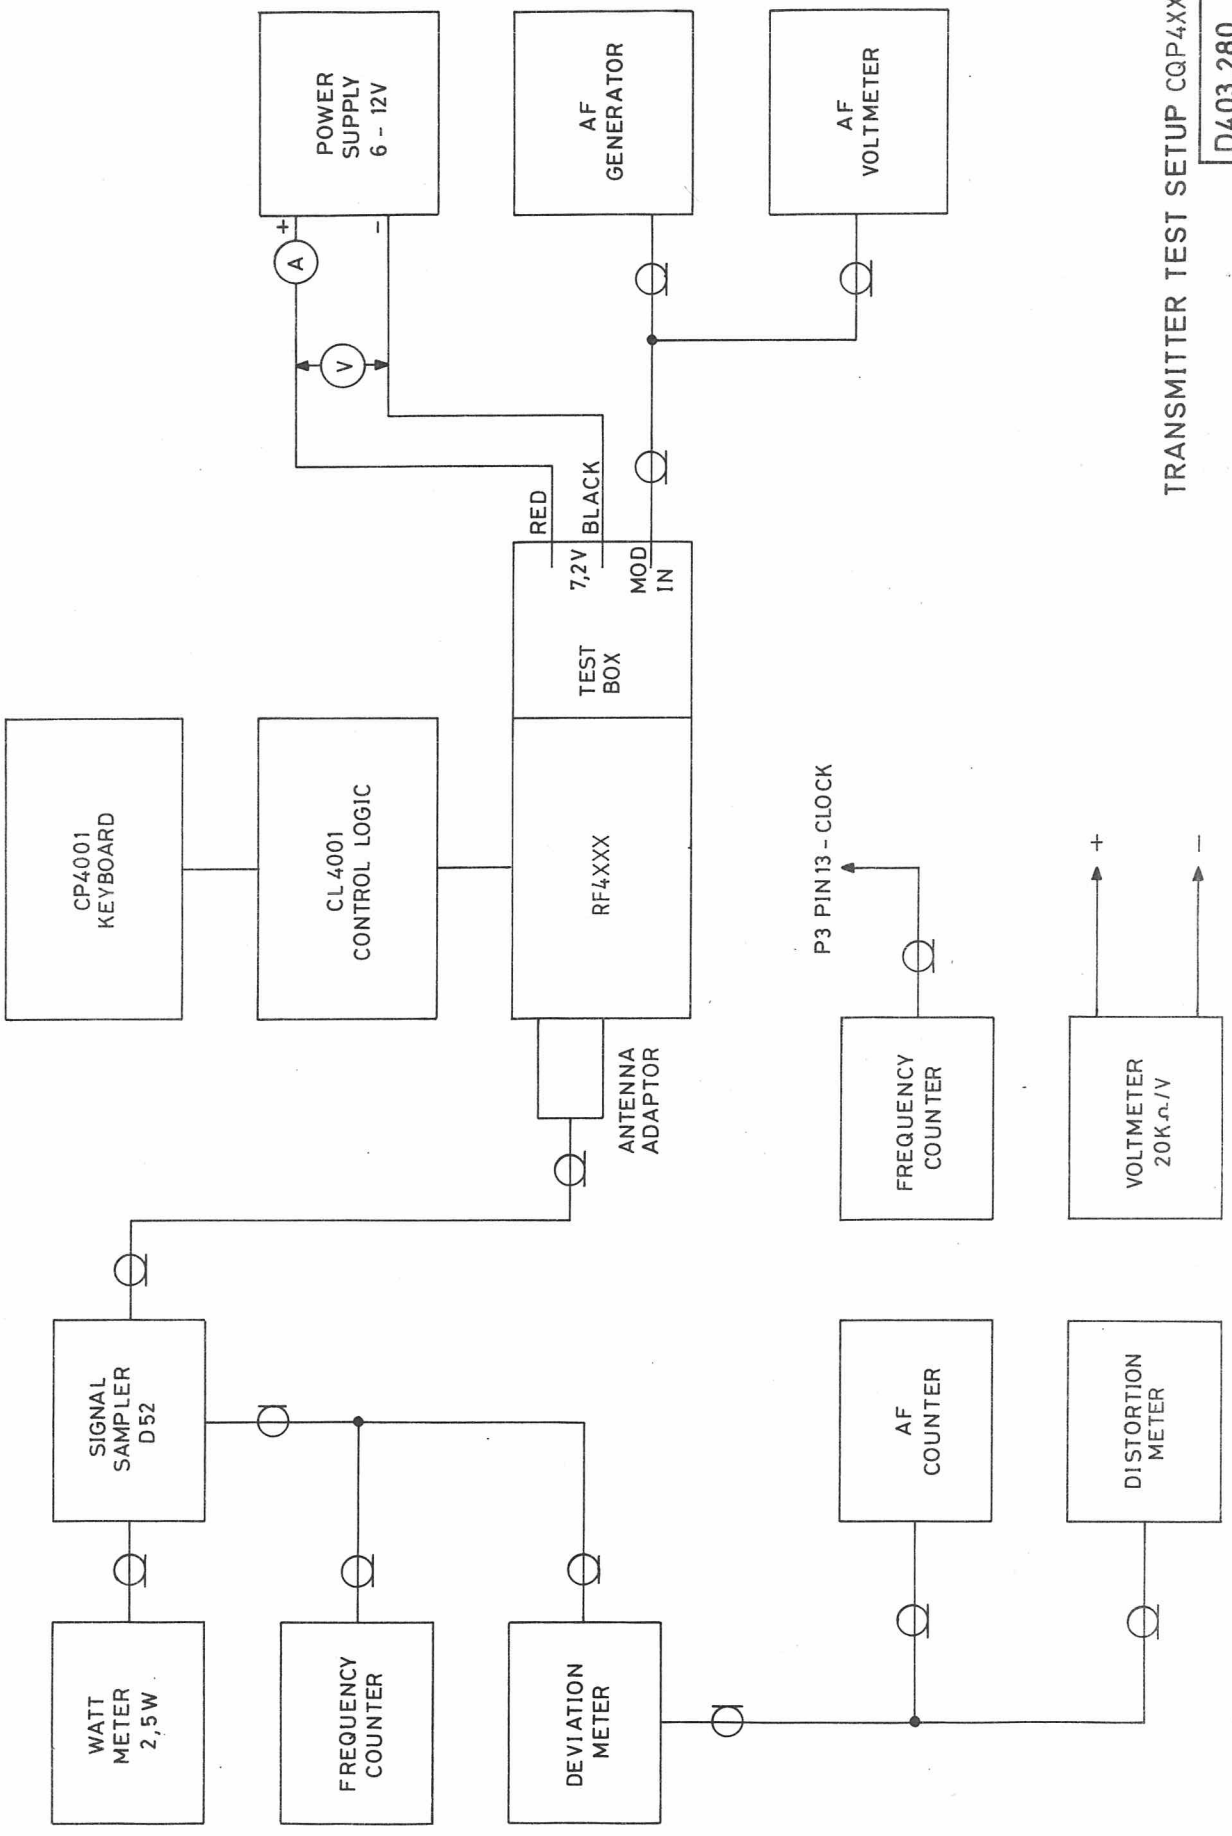
CQP4662: ±5 kHz
CQP4663: ±4 kHz
CQP4664: ±2.5 kHz

Set the AF generator frequency to 1000 Hz.
Reduce the AF generator output until a deviation of 0.7 x maximum deviation is obtained:

CQP4662: ±3.5 kHz
CQP4663: ±2.8 kHz
CQP4664: ±1.75 kHz

Typical generator output is 100 mV.

TRANSMITTER TEST SETUP CQP4XXX D403.280



RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Preset coil L508 as follows:

High end of band: 2/3 out of coil.
Low end of band: Fully down in coil form.

Set SQ switch to cancel.
Adjust C514 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.
Adjust C514 for a reading of 3 Volts. For radios with 2 channels adjust C514 so that the reading for each channel is inside the tuning range, 1-5 V. The channel with the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.
Adjust L508 for maximum voltmeter reading, 0.13 V ±0.02 V. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel frequency.

Modulate the signal generator with 1000 Hz to 0.7 x maximum system deviation.

CQP4662: ±3.5 kHz
CQP4663: ±2.8 kHz
CQP4664: ±1.75 kHz

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.
Reduce the signal generator output until voltage reading is less than 1 V.

Adjust L402 and L308 for maximum voltmeter reading.
Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.
Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE
Connect the distortion meter to AF OUT.
Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14.
Set signal generator as described in paragraph 3.
Adjust R409 for a voltmeter reading of 110 mV ±5 mV.

5. FRONT-END ADJUSTMENT

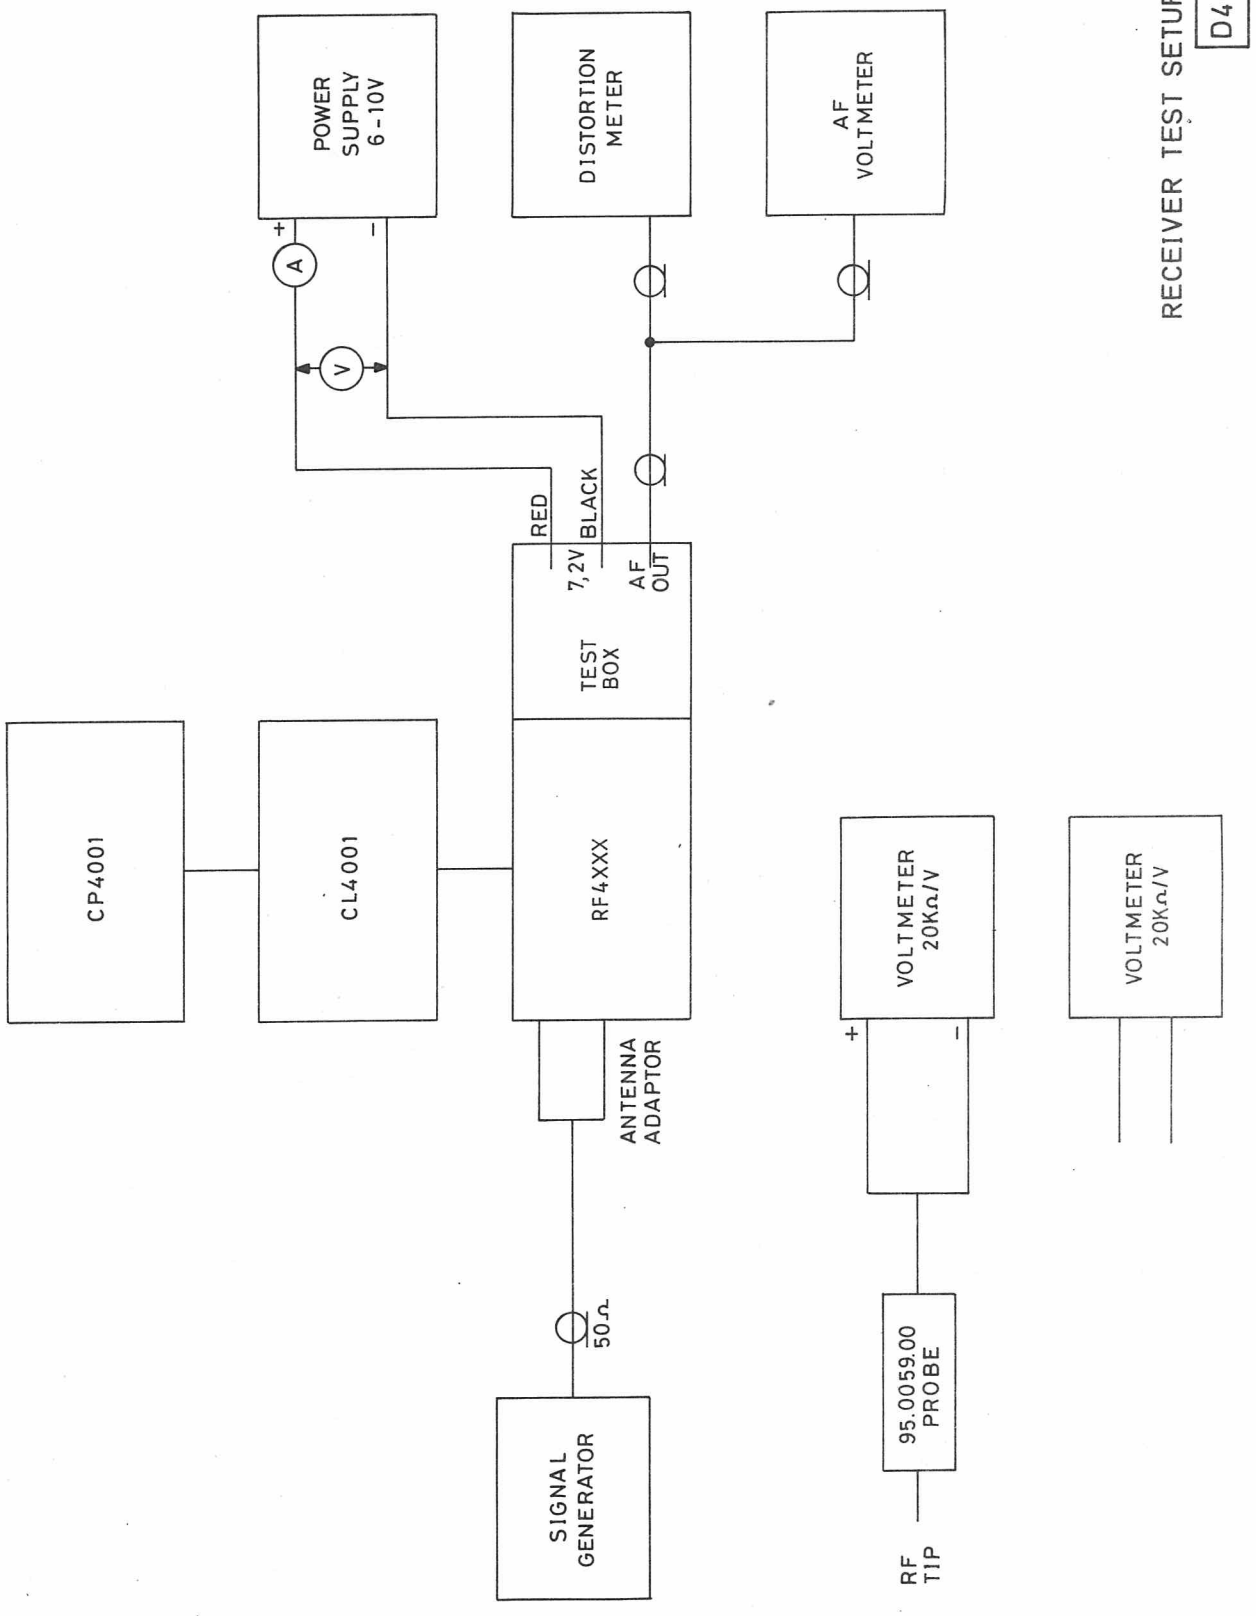
Connect the signal generator to the antenna connector and set its frequency to the channel frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.
Connect a distortion meter to AF OUT.
Set the LS-LINE switch on the test box to LINE.
Set the SQ switch to cancel.

Adjust the following coils for minimum distortion. L508, L302, L303, L305, L307 and L306.
As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.

RECEIVER TEST SETUP CQP4XXX D403.281



Check the 12 dB SINAD on both channels, if used.
Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.
Open squelch by setting SQ switch to cancel.

Set the signal generator output to the value giving 12 dB SINAD.
Close squelch by setting SQ switch to normal.
Slowly turn R420 clockwise to the point where the squelch just opens.
Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD
Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.
Turn the radio off and remove the test box.
Assemble the radio but use the service cabinet to hold the chassis box.
Connect the test box and turn the radio on.
Connect a frequency counter to the signal sampler, refer to transmitter test setup.
Key the transmitter.
Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.
Requirement:

$F = F_{nom} \pm 0.2$ ppm (225 Hz at 450 MHz).

Switch to channel 2 and verify the frequency. (Channel switching is not possible while transmitting).

ADJUSTMENT OF HELICAL ANTENNA AN4xx1

The AN4xx1 is adjusted by a ferrite slug which can be pulled up or pushed down inside the antenna radiator. The slug should be adjusted to a position where maximum power is being radiated.
Remove the antenna cap for access to the tuning wire (fish line).

Place the field strength indicator in opright position on a non-metallic surface of at least 50x50 cm.

Hold the radio in upright position and key the transmitter.

Adjust the distance between the radio and the signal strength indicator for a clear indication of signal pick-up.

Adjust by pulling the tuning slug up or down for maximum signal strength.
This adjustment is sensitive to proximity effects and the hand's position, and several positions should be tried for optimum result-check current drain which should not exceeding 1 A.
Lock the tuning wire with the conical insert and cut the wire.

Mount antenna cap.

Note:
If a signal strength indicator D37 is not available a diode probe with a signal pickup wire and a multimeter or a deviation meter with a signal strength meter can be used to measure the radiated power.

2/10 CHANNELS VERSION

- ADJUSTMENT PROCEDURE
- TEST POINTS AND ADJUSTABLE COMPONENTS

ADJUSTMENT PROCEDURE

CQP4660

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4662: 400-470MHz - 25 kHz channel spacing
CQP4663: 400-470MHz - 20 kHz channel spacing
CQP4664: 400-470MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4660:

RF Signal Generator	400-470 MHz
AF Voltmeter	Z_i >0.5 Mohm
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	Z_{out} ≥600 ohm
Frequency counter	5-500 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1
Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

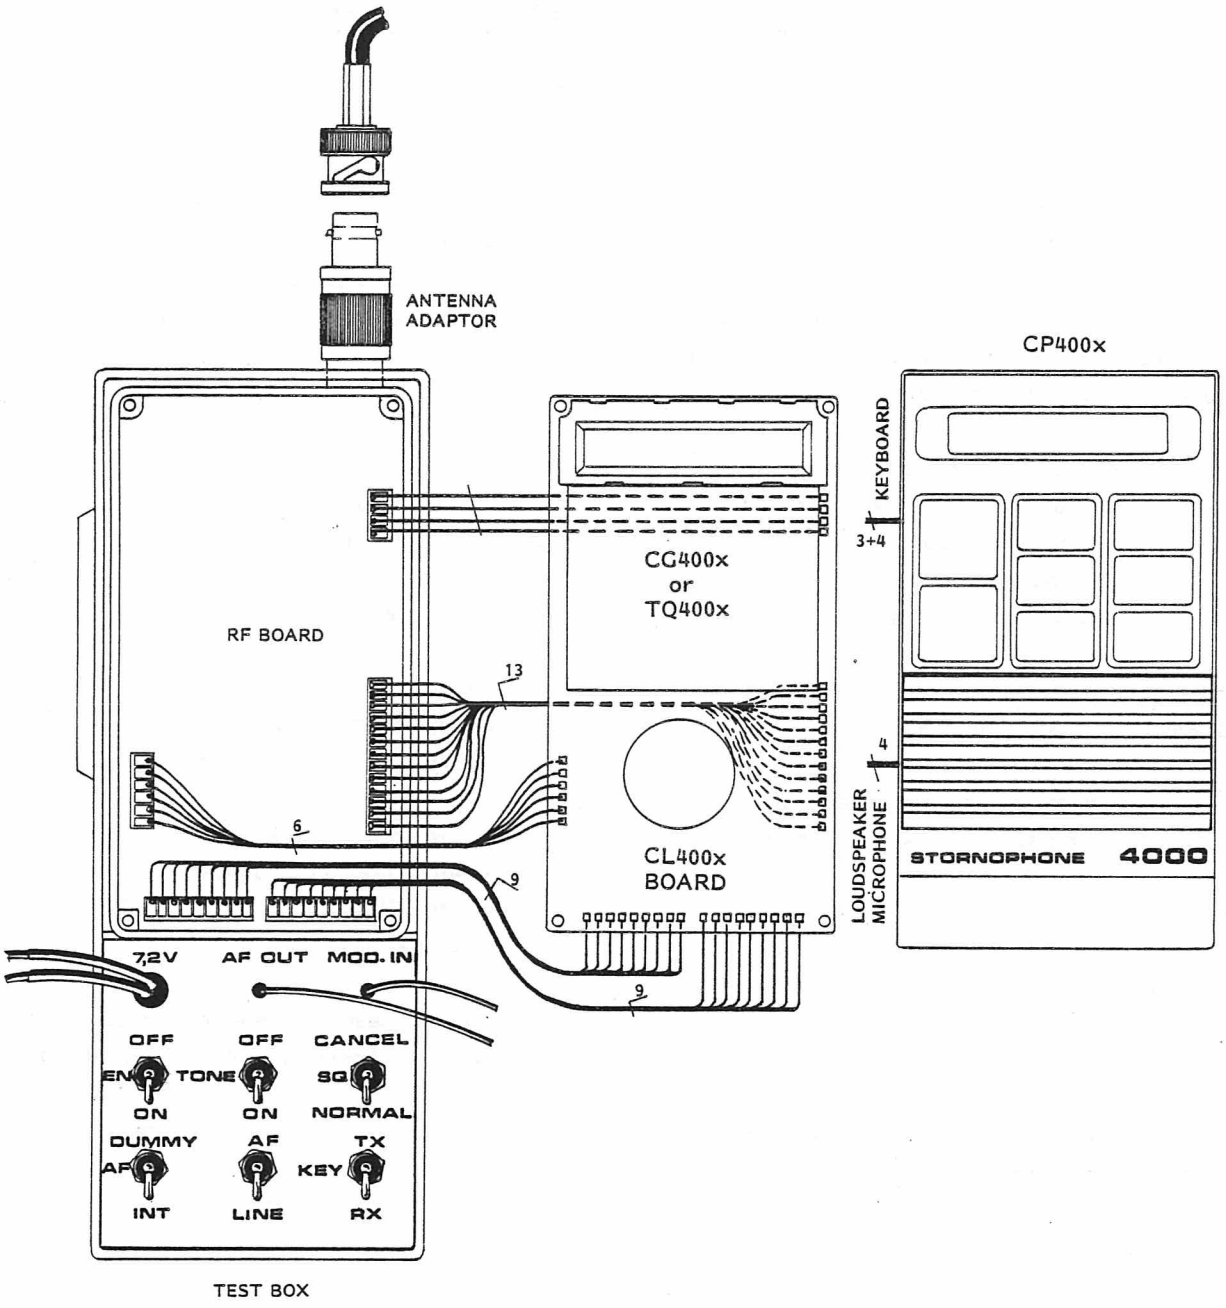
Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
  Take the CL400x board and the RF466x board apart.
  Connect the CL400x board to the RF466x board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.
Set the power supply voltage to 7.2 V.
Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.
Connect the voltmeter to the +5.5 V test point.
Read the 5.5 V regulated voltage.



TEST SETUP
STORNOPHONE 4000

D403.279/3

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13-CLOCK.
Read the reference frequency.
Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).
Adjust C533 for f_{nom} ±10 Hz.

Note:
The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.
Key the transmitter and read the current drain.
Requirement: less than 1 A.
Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Adjust C504 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.
Adjust C504 for a voltage reading of 3 V. For radios with more than 1 channel adjust C504 so that the reading for each channel is inside the tuning range, 1 - 3 V. The channel having the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Select the channel whose frequency is closest to the center frequency. Connect the wattmeter to the antenna connector.
Adjust ADC potentiometer R115 for rated output power according to the type designation.
Note:
The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.
Connect the frequency counter to the signal sampler.
Key the transmitter and read the frequency.
Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).
Requirement: F_{nom} ±0.2 ppm (225 Hz at 450 MHz)
Deenergize the transmitter.
Select next channel.
Key the transmitter and check for correct output frequency for each channel.

NOTE:
Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Select the channel whose frequency is closest to the center frequency.
Connect the deviation meter to the signal sampler.
Connect the AF generator to MOD IN on the test box.
Set the AF generator frequency to 1000 Hz and the output as follows:
1100 mV with test box (11:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

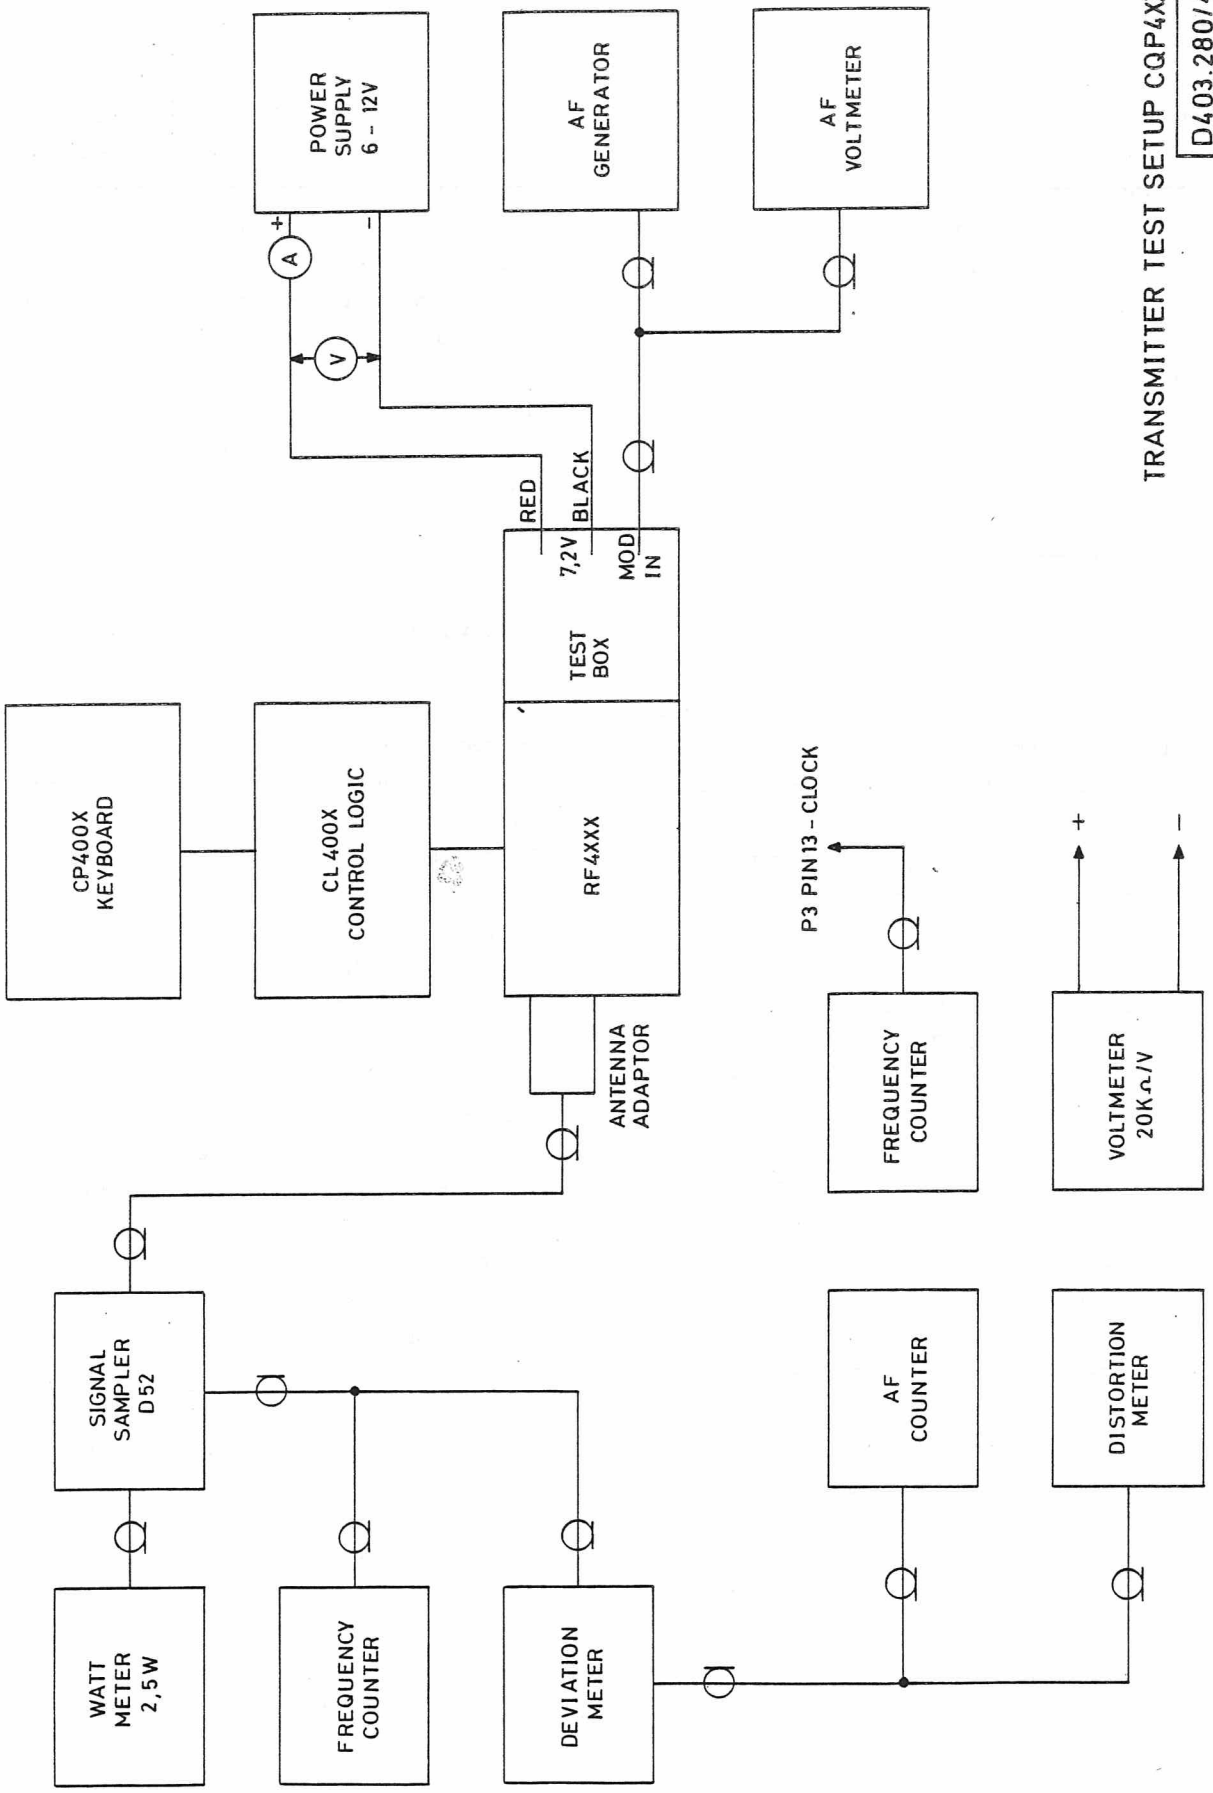
CQP4662: ±5 kHz
CQP4663: ±4 kHz
CQP4664: ±2.5 kHz

Set the AF generator frequency to 1000 Hz.
Reduce the AF generator output until a deviation of 0.7 x maximum deviation is obtained:

CQP4662: ±3.5 kHz
CQP4663: ±2.8 kHz
CQP4664: ±1.75 kHz

Typical generator output is 100 mV.

TRANSMITTER TEST SETUP CQP4XXX D403.280/4



RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.
Preset coil L508 as follows:
High end of band: 2/3 out of coil.
Low end of band: Fully down in coil form.
Set SQ switch to cancel.
Adjust C514 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.
Adjust C514 for a voltage reading of 3 V. For radios with more than 1 channel adjust C514 so that the reading for each channel is inside the tuning range, 1 - 3 V. The channel having the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.
Adjust L508 for maximum voltmeter reading, 0.13 V ±0.02 V. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel whose frequency is closest to the center frequency.

Modulate the signal generator with 1000 Hz to 0.7 x maximum system deviation.
CQP4662: ±3.5 kHz
CQP4663: ±2.8 kHz
CQP4664: ±1.75 kHz

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.
Reduce the signal generator output until voltage reading is less than 1 V.
Adjust L402 and L308 for maximum voltmeter reading.
Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.
Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE
Connect the distortion meter to AF OUT.
Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14.
Set signal generator as described in paragraph 3.
Adjust R409 for a voltmeter reading of 110 mV ±5 mV.

5. FRONT-END ADJUSTMENT

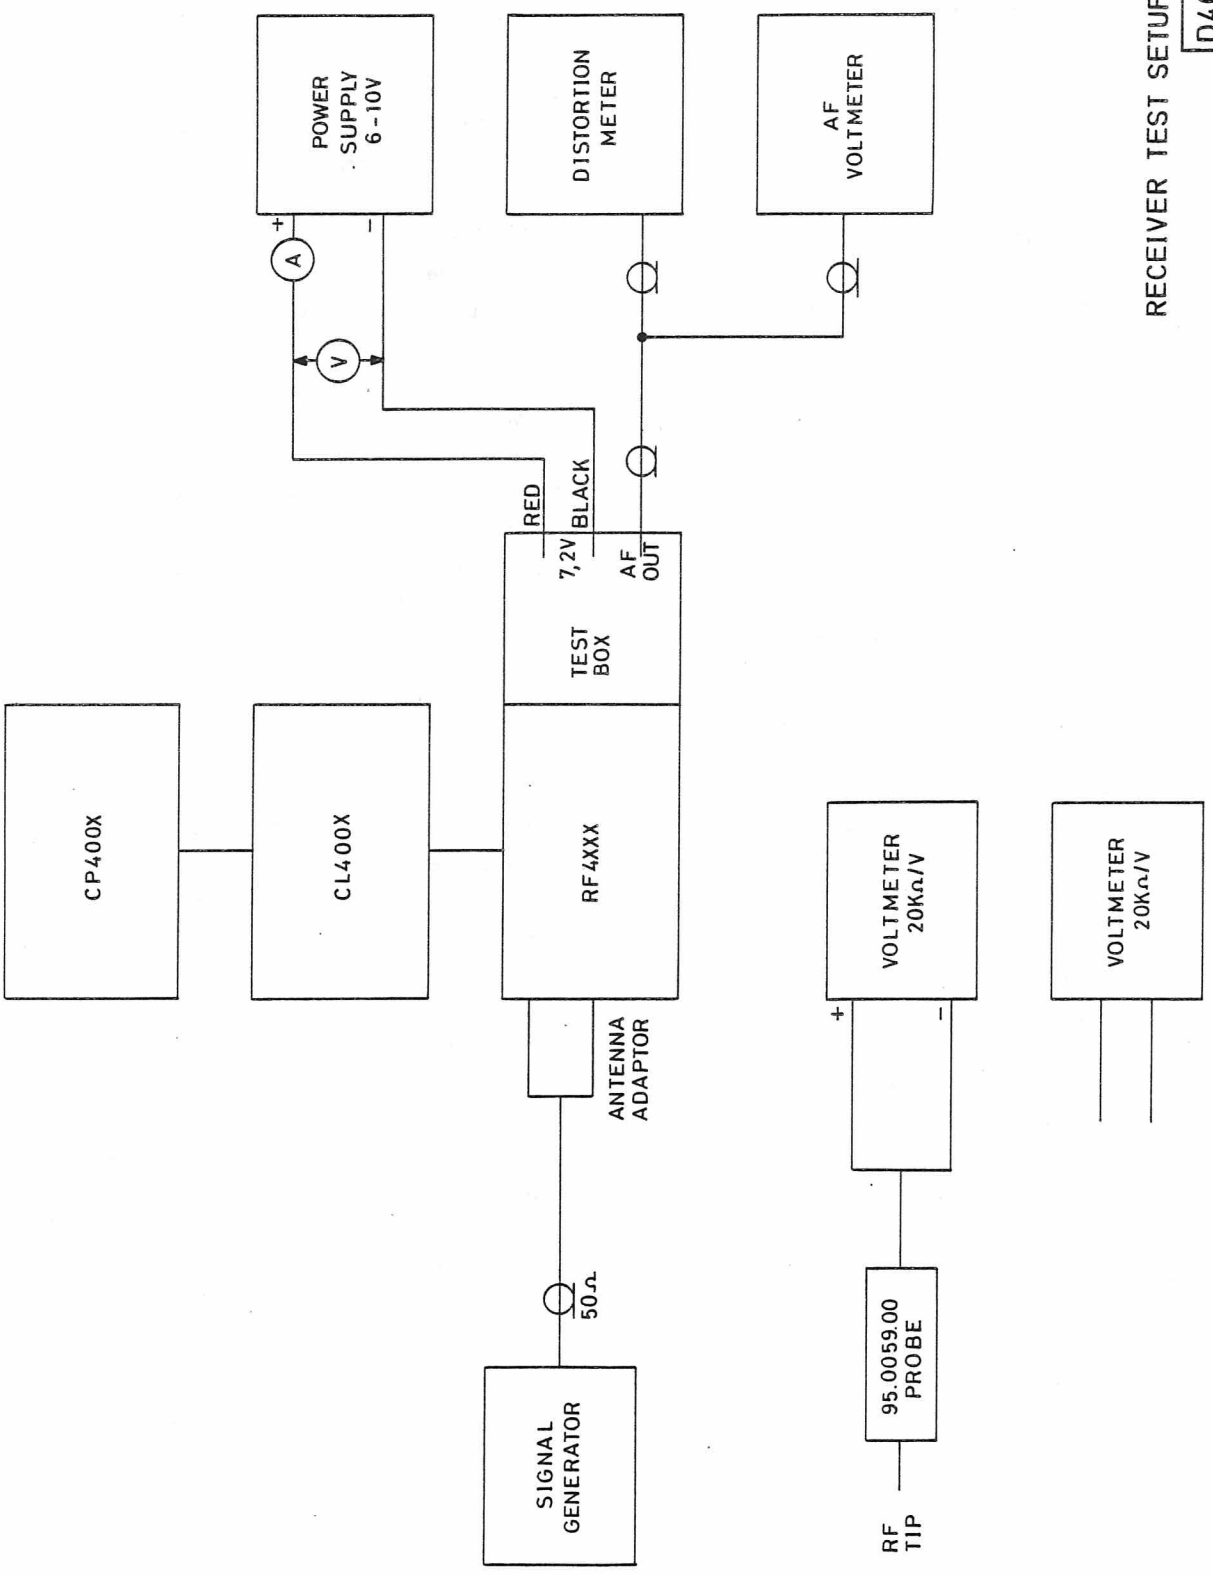
Connect the signal generator to the antenna connector and set its frequency to the channel whose frequency is closest to the center frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.
Connect a distortion meter to AF OUT.
Set the LS-LINE switch on the test box to LINE.
Set the SQ switch to cancel.

Adjust the following coils for minimum distortion.
L508, L302, L303, L305, L307 and L306.

Note:
If any of the 6 tuning screws: Code J707257P2 - "long" exceeds any of the 3 covers:
Code J707808G1 - with more than 1 mm, - then it/they must be replaced by tuning screw:
Code J707257P1 - "short".

RECEIVER TEST SETUP CQP4XXX D403.281/4



As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.
Check the 12 dB SINAD on all channels.

Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.

Open squelch by setting SQ switch to cancel.
Set the signal generator output to the value giving 12 dB SINAD.

Close squelch by setting SQ switch to normal.
Slowly turn R420 clockwise to the point where the squelch just opens.

Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD
Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.
Turn the radio off and remove the test box.
Assemble the radio but use the service cabinet to hold the chassis box.
Connect the test box and turn the radio on.
Connect a frequency counter to the signal sampler, refer to transmitter test setup.
Key the transmitter.
Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.
Requirement:

$F = F_{nom} \pm 0.2$ ppm (225 Hz at 450 MHz).

Select all channels used and verify the frequency. (Channel switching is not possible while transmitting).

ADJUSTMENT OF WHIP ANTENNA AN4661

Place the field strength indicator in opright position on a non-metallic surface of at least 50x50 cm.

Hold the radio in upright position and key the transmitter.

Adjust the distance between the radio and the signal strength indicator for a clear indication of signal pick-up.

Adjust by cutting to length for maximum signal strength.
The adjustment is sensitive to proximity effects and the hand's position. Check current drain which should not exceeding 1 A.

Mount antenna cap.

Note:
If a signal strength indicator D37 is not available a diode probe with a signal pickup wire and a multimeter or a deviation meter with a signal strength meter can be used to measure the radiated power.
